

**NEW YORK STATE
COASTAL MANAGEMENT PROGRAM
AND
FINAL ENVIRONMENTAL IMPACT
STATEMENT**

This document incorporates all of the approved routine program changes from 1982 to 2023.

Prepared by:

Office of Coastal Zone Management
National Oceanic and Atmospheric Administration
Department Of Commerce

The preparation of this publication was financed in part through the office of
Coastal Zone Management, NOAA.

DESIGNATION: Final Environmental Impact Statement

TITLE: Proposed Federal Approval of the New York Coastal Program

ABSTRACT: The State of New York has submitted its Coastal Program to the Office of Coastal Zone Management for approval. Approval would allow program administrative grants to be awarded to the State, and would require that Federal actions be consistent with the program. This document includes a copy of the program (Volume 1), which is a comprehensive management program for coastal land and water use activities. It consists of numerous policies on diverse management issues which are administered under existing State laws and is the culmination of several years of program development. New York's coastal policies either: promote the beneficial use of coastal resources, prevent their impairment, or deal with major activities that substantially affect numerous resources. The program will improve decision-making processes used for determining the appropriateness of actions in the coastal area.

Approval and implementation of the program will enhance governance of the State's coastal land and water areas and uses according to the coastal policies and standards contained in the existing statutes, authorities and rules. Federal alternatives to program approval include delaying or denying approval, if certain requirements of the Coastal Zone Management Act have not been met. The State could modify parts of the program or withdraw their application for Federal approval if either of the above Federal alternatives results from circulation of this document.

APPLICANT: State of New York, Secretary of State

LEAD AGENCY: U.S. Department Of Commerce
National Oceanic and Atmospheric Administration
Office of Coastal Zone Management

Washington, D.C. 20235

August 13, 1982

Dear Mr. Matuszeski:

I am pleased to submit New York State's Coastal Management Program and Final Environmental Impact Statement.

As Secretary of State, I have been designated, pursuant to the Waterfront Revitalization and Coastal Resources Act of 1981, and Chapter 464 of the 1975 Laws of New York State, to prepare and implement a coastal management program. This document is the culmination of years of local, state and federal government efforts, as well as those of groups representing civic, environmental, development, and other interests.

The public and government officials have had numerous opportunities to shape this program. Public meetings, held in 1978, were followed by public hearings in early 1979 conducted by this agency. Legislative hearings were held in late 1979. There were over 1,000 meetings to assist in the preparation of this document. As a result of the comments received, the State's program uses a networking approach enforced primarily through the existing New York State Environmental Quality Review Act.

In accordance with the provisions of Section 102(2) (c) of the National Environmental Policy Act of 1969, 1,500 copies of the Draft Environmental Impact Statement on the proposed New York State Coastal Management Program were circulated for review and comment to Federal, State, regional and local government agencies as well as to numerous private interest groups. In response to the many comments received, numerous changes have been made to the program.

In accordance with the requirements of the Coastal Zone Management Act regulations (Section 923.48), a letter from the Governor will follow after the minimum ten-day review following the notice of availability of the Final Environmental Impact Statement. This review period is a requirement of the New York State Environmental Quality Review Act regulations (6NYCRR Section 617.9).

Upon completion of the Federal review process, we anticipate New York State will have an approved Coastal Management Program in September, 1982.

Sincerely,

Basil A. Paterson

PART I. OVERVIEW

SUMMARY OF THE NEW YORK STATE MANAGEMENT PROGRAM

This document constitutes a framework for government decision-making which affects New York's coastal area. It provides statements of policy to which federal and State agencies must adhere and also serves as a reference for local government action in the coastal area. In addition, the document complies with federal regulations for submission of state coastal management programs set forth pursuant to the Coastal Zone Management Act of 1972, as amended, and constitutes the environmental impact statement for the State Program.

New York is unique among coastal states. It contains within its coastal boundary a great diversity of marine and freshwater areas divided into four distinct sectors: Long Island, a land mass fronting on the Atlantic Ocean; New York City, a major international port where the intensity of land and water uses is the greatest in the State; the Hudson River Valley, an ecologically and historically important corridor that extends 150 miles from New York City into upstate New York; and the Great Lakes - St. Lawrence River region, a vast freshwater, non-tidal coastal system.

While New York's coastal area is extensive and varied, a number of issues emerge as common to all sectors. The first and most obvious has been that, although New York has numerous laws, programs, and regulations to manage coastal resources and activities, State agencies were not fully coordinating their activities with each other, and as a result, inconsistent decisions about the use of coastal resources were made.

The Coastal Management Program has provided a means for improving this situation by describing in this document the forty-four coastal policies with which all State agency actions must be consistent. Generally, the policies fall under three headings: promotion of beneficial use of coastal resources; prevention of their impairment; and management of major activities substantially affecting numerous resources. The criteria embodied in these policies require all agencies to take into account the interrelationships that exist or should exist in the coastal area.

The main instruments for implementing the forty-four policies are a number of regulatory and management State authorities assigned to the New York State Department of State, the Department of Environmental Conservation, the New York State Energy Research and Development Authority (NYSERDA), the Public Service Commission, and the Office of Parks, Recreation and Historic Preservation. Among these authorities is the Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law, Article 42), which forms the basis for coordinating all State actions affecting the coastal area. Article 42 requires that the State Environmental Quality Review Act (Environmental Conservation Law, Article 8) be amended to assure adequate consideration of coastal policies and to provide that the Secretary of State review agency actions affecting achievement of coastal policies.

Nine other issues were found to affect all sectors of New York's coastal area. The Waterfront Revitalization of Coastal Areas and Inland Waterways law gave the Coastal Management Program authority to advocate specific actions to meet or cope with these issues. The specific actions which the Coastal Management Program advocates include: promoting waterfront revitalization; promoting water dependent uses; protecting fish and wildlife habitats; protecting and enhancing scenic areas; protecting and enhancing

historic areas, protecting farmlands; protecting and enhancing small harbors; protecting and enhancing public access; providing research, data, and information for participation of government agencies and citizens concerned with the State's coastal area; and coping with erosion and flooding hazards. The last action necessitated passage of the Coastal Erosion Hazard Area law.

The Coastal Management Program, in its dual role of coordinator and advocate, also seeks the voluntary assistance of local governments to help further its goals. Coastal communities are encouraged to participate under the Waterfront Revitalization of Coastal Areas and Inland Waterways law which provides the means and incentives for municipalities to prepare and implement local waterfront revitalization programs. The Department of State will provide financial and technical assistance, as well as guidelines for developing local programs. A community may receive one twelve-month grant of up to 50% of its costs to develop a local program.

New York City has already developed a local program. The program can be found in Volume III of this document.

When a local waterfront revitalization program has been approved by the Secretary of State, the local government will be eligible to receive additional funding for preconstruction activities related to projects recommended in the program. State consistency applies automatically to any approved local program. Furthermore, an approved local program may be incorporated into the State Coastal Management Program; federal consistency provisions of the Program would then apply.

CHANGES THE PROGRAM WILL MAKE

The New York Coastal Management Program, in addition to furthering national coastal management goals, will cause changes in the way existing environmental and economic development activities of State agencies affect the use of coastal resources, and it will offer local governments and private interests the means to focus on the waterfront and bring about solid improvements. More specifically:

- Forty-four coastal management policies will apply to State agency decisions and voluntarily adopted local government waterfront revitalization programs. Twenty-nine of these policies are new or have significantly increased enforceability as a result of the State's Waterfront Revitalization of Coastal Areas and Inland Waterways law. Fifteen of the policies are from such existing State laws as the Freshwater Wetlands Act and Tidal Wetlands Act.
- Development in areas subject to erosion and on beaches and dunes will be set back from the shorelines a distance sufficient to minimize damage from erosion.
- All activities involving a State permit, funding or other action will be undertaken in a manner consistent with the coastal policies.
- Protection of significant fish and wildlife habitats, significant coastal scenic areas, and important agricultural lands will be increased.
- The Department of State and the Office of Business Permits must consolidate, simplify, expedite or otherwise improve existing permit procedures which affect development in the coastal area.
- Non-structural measures for erosion control will be promoted.

- Land development will be encouraged to locate in areas where infrastructure and public services are adequate.
- The Department of State, Urban Development Corporation, Environmental Facilities Corporation, Departments of Commerce, Environmental Conservation, Transportation, and others must seek new and alternative means of effectuating waterfront revitalization.
- State agencies and local governments with approved waterfront revitalization programs must promote and protect the traditional character and uses of small harbors.
- Within the existing major ports, State agencies and local governments with approved waterfront revitalization programs must site land uses and development which are essential to or in support of waterborne transportation of cargo and people.
- Enforcement capabilities will be increased for existing State programs which protect natural coastal resources, and for those existing State programs which promote proper development of coastal resources.
- Federal agency actions will be consistent with the coastal policies.
- State and federal agency actions will also be consistent with approved local waterfront revitalization programs.
- Financial assistance will be provided to local governments to prepare and implement local ordinances for erosion hazard areas and waterfront revitalization programs.
- State and local agencies will be provided technical assistance in solving coastal problems.

THE FEDERAL COASTAL ZONE MANAGEMENT ACT

In response to intense pressure, and because of the importance of coastal areas of the United States, Congress passed the Coastal Zone Management Act of 1972 (CZMA) (P.L. 92-583). The Act authorizes a federal grant-in-aid program to be administered by the Secretary of Commerce, who in turn delegated this responsibility to the National Oceanic and Atmospheric Administration's (NOAA) Assistant Administrator for Coastal Zone Management, who heads the Office of Coastal Zone Management (OCZM).

The CZMA was substantively amended on July 16, 1976 (P.L. 94-370) and on October 1, 1980 (P.L. 96-464). The Act and its amendments affirm a national interest in the effective protection and careful development of the coastal zone, by providing assistance and encouragement to coastal states (and U.S. territories) to voluntarily develop and implement management programs for their coastal areas. Financial assistance grants under Sections 305 for program development and 306 for program implementation were authorized by the CZMA to provide coastal states and territories with the means for achieving these objectives.

Broad guidelines and the basic requirements of the CZMA provide the necessary direction to states for developing their coastal management programs. The program development and approval provisions are contained in 15CFR Part 923, revised and published March 28, 1979, in the Federal Register. In summary, the requirements for program approval are that a state develop a management program that:

1. Identifies and evaluates those coastal resources recognized in the Act that require management or protection by the state or territorial government.
2. Reexamines existing policies or develops new policies to manage these resources. These policies must be specific, comprehensive, and enforceable, and must provide an adequate degree of predictability as to how coastal resources will be managed.
3. Determines specific uses and special geographic areas that are to be subject to the management program, based on the nature of identified coastal concerns. Uses and areas to be subject to management should be based on resource capability and suitability analyses, socio-economic considerations and public preferences.
4. Identifies the inland and seaward areas subject to the management program.
5. Provides for the consideration of the national interest in the planning for and siting of facilities that meet more than local requirements.
6. Includes sufficient legal authorities and organizational arrangements to implement the program and to ensure conformance to it.

In arriving at these substantive aspects of the management program, states are obliged to follow an open process which involves providing information to and considering the interests of, the general public, special interest groups, local governments, and regional, state, interstate, and federal agencies.

Section 303 of the CZMA provides guidance of specific national objectives that warrant full consideration during the implementation of approved state coastal management programs.

Section 305 of the CZMA authorizes a maximum of four annual grants to develop a coastal management program. After developing a management program, the state is then eligible for annual grants under Section 306 to implement its management program. If a program has deficiencies which need to be remedied or has not received approval by the time Section 305 program development grants have expired, a state may continue development of a federally approvable coastal management program using entirely state funding. However, new federal funding assistance for program development is no longer authorized by the 1980 CZMA amendments.

Section 306 requires states to devote increasing portions (up to 30 percent) of their grant funds to activities leading to significant improvements in achieving national coastal management objectives. Section 306(1) also authorizes the award of grants for preservation of important natural areas, public access and urban development. Section 306(A) encourages states to inventory coastal resources of national significance and develop standards to protect them.

Section 307 of the Act stipulates that federal agency activities shall be consistent, to the maximum extent practicable, with approved state management programs. Section 307 further provides for mediation by the Secretary of Commerce when a serious disagreement arises between a federal agency and a coastal state with respect to a federal consistency issue.

Section 308 of the CZMA contain provisions for grants and loans to coastal states to enable them to plan for and respond to onshore impacts resulting from coastal energy activities including grants to mitigate the coastal impacts of fuel transportation and alternative ocean energy activities. To be eligible for assistance under Section 308, coastal states must be receiving Section 305 or 306 grants, or, in the Secretary's view,

be developing a management program consistent with the policies and objectives contained in Section 303 of the CZMA.

Section 309 allows the Secretary to make grants to states to coordinate, study, plan, and implement interstate coastal management programs.

Section 310 allows the Secretary to conduct a program of research, study, and training to support state management programs. The Secretary may also make grants to states to carry out research studies and training required to support their programs.

Section 312 directs OCZM to evaluate the performance of state coastal management programs on a continuing basis.

Section 315 authorizes grants to states to acquire lands for access to beaches and other public coastal areas of environmental, recreational, historical, aesthetic, ecological, or cultural value, and for the acquisition of islands for preservation, in addition to the estuarine sanctuary program to preserve a representative series of undisturbed estuarine areas for long-term scientific and educational purposes.

CROSS REFERENCE TO PROGRAM REQUIREMENTS (306)

How the New York Coastal Program Meets the Requirements of the Coastal Zone Management Act.

Requirements	Regulations	New York Coastal Program

Sec. 306(d), which includes:		
306(d)(1): Administer regulation, control development; resolve conflicts	923.41	Part II, Section 4
306(d)(2): Powers of acquisition, if necessary	923.41	Part II, Section 4, 6; Appendix A, F
Sec. 306(e), which includes:		
306(e)(1): Technique of control	923.42 -923.44	Part II, Section 4, 5, 8; Appendix A
306(e)(2): Uses of regional benefit	923.12	Part II, Section 9
Sec. 307, which includes:		
307(b): Adequate consideration of federal agency views.	923.51	Part VI; Part IX; Appendix C
307(f): Incorporation of air and water quality requirements	923.45	Part II, Section 6
*SEQR requires a minimum ten days review after notice of availability of FEIS prior to gubernatorial approval.		

PART II. DESCRIPTION OF THE NEW YORK STATE COASTAL MANAGEMENT PROGRAM

SECTION 1 - INTRODUCTION

New York State's coast is recognized as one of the State's greatest assets. It is unique, for it contains a variety of natural, recreational, industrial, commercial, cultural, aesthetic, and energy resources of local, statewide and national significance. Unfortunately, the coast is severely threatened by competing demands. The resources of the State's Coastal Area are increasingly subject to the pressures of population growth and economic development, which include requirements for industry, commerce, housing, recreation and energy production. These demands result in the loss of living marine resources and wildlife, the diminution of open space areas, shoreline erosion, permanent adverse changes to ecological systems, and a loss of economic opportunities.

To address these coastal problems and provide a means for resolving them, the New York State Department of State has prepared, in cooperation with the federal government, other State agencies, the State Legislature, local governments and the interested public, a statewide Coastal Management Program. This proposed Program has three major parts:

- The first establishes the boundaries of the Coastal Area within which the Program applies.
- The second describes the organizational structure to implement the Program.
- The third provides a set of statewide policies enforceable on all State and federal agencies which manage resources along the State's coastline.

NEW YORK STATE'S COASTAL MANAGEMENT PROGRAM

The New York State Legislature has, over the years, enacted legislation and established programs for protecting the State's valuable natural and human-made resources. The proposed Coastal Management Program is built upon these existing laws and programs. However, during the development of the Program, it was found that additional legislation was needed: (1) to protect shore owners and their property from the damages caused by severe erosion, (2) to provide a method to accomplish coastal management objectives through coordination of existing programs and by developing a consensus among all levels of government and the private sector to achieve these objectives, and (3) to establish enforceable policies for State and federal actions in the coastal area. In 1981, the New York State Legislature passed and Governor Carey signed into law two bills which will enable New York to meet these requirements. The Coastal Erosion Hazard Areas law (Environmental Conservation Law Article 34) and the Waterfront Revitalization of Coastal Areas and Inland Waterways law (Article 42 of the Executive Law).

The Waterfront Revitalization of Coastal Areas and Inland Waterways law establishes a balanced statewide approach for encouraging development in the coastal area while protecting natural coastal resources. The law establishes boundaries for the State's Coastal Area by adopting a map which defines the area within which the Coastal Management Program will apply. It provides a set of policies which address significant

coastal issues. State agencies will use the Department of State's review procedures and the existing State Environmental Quality Review Act (SEQRA) process to abide by these policies in their decisions.

The Act's coastal policies encourage the development and use of existing ports and other areas where infrastructure and public services are adequate. They also encourage facilitation of public access to coastal locations for recreational purposes. Certain policies affirm the need to protect and appropriately revitalize or develop such natural and human-made resources as fish and wildlife habitats, agricultural lands, other open space areas, and scenic and historic resources. One policy concerns protection of natural and human-made features from damage caused by flooding and erosion.

OPTIONAL LOCAL WATERFRONT REVITALIZATION PROGRAMS

The new law offers local governments the opportunity to participate in the State's Coastal Management Program on a voluntary basis. Localities are encouraged to prepare and adopt local waterfront revitalization programs which in turn, would provide more detailed implementation of the State's Program through use of existing broad powers such as those covering zoning and site plan review. With a waterfront revitalization program approved by the Secretary of State, a locality may take advantage of certain tangible benefits. First, the Department of State is empowered to provide technical and financial assistance for the preparation and implementation of local programs. Secondly, State agencies' actions must be consistent with approved local programs to the maximum extent practicable. Thirdly, if a State's Coastal Management Program is amended to include the approved local program, federal agencies will be required to adhere to this program to the same degree which is required of State agencies.

PUBLIC PARTICIPATION

The core of the State's public involvement is the New York State Citizen's Advisory Committee. The advisory body is made up of representatives from the five coastal regions of the State. The Committee met regularly during the development of the Program to review technical reports, make recommendations on its content and legislative proposals and assist in public participation activities.

The Coastal Management Program has also been shaped by comments and suggestions from a wide variety of interest groups. This was a deliberate attempt to involve people and groups who are interested in and potentially affected by the Program. The Department of State actively sought input from the public and local interest groups, including local government, in developing the State's Coastal Management Program. In all, over one thousand meetings were held during the Program's development. At a very early stage in its preparation, a series of sixteen public meetings were held at various points along the coast, to solicit public comments on the general approach. The initial draft document and the proposed legislation derived from this input. The draft Program, in turn, was aired publicly, at a series of eight public hearings held in all areas of the coast during the spring of 1979.

Based upon comments received at these hearings, the proposed legislation was substantially revised and introduced in the Legislature in May of 1979. Informational bulletins were at that time forwarded to all members of the public who had registered at the hearings, to update them, and demonstrate that their concerns were reflected in the proposed legislation.

In the fall of 1979, further hearings were held by the State Legislature, and following additional bill revisions, in the spring of 1980, the Department sent further informational bulletins to the interested public.

In response to further comment by public interest groups, the proposed legislation was again substantially revised and reintroduced in the 1981 legislative session where it was overwhelmingly approved. The Governor signed this legislation into law in July, 1981.

The State's proposed Coastal Management Program and Draft Environmental Impact Statement (CMP-DEIS) were distributed to interested agencies and organizations (See Part VII of this document). In July, 1982, hearings were held in Buffalo, Albany and New York City to receive additional public comment. This document contains responses to all comments received on the CMP-DEIS (See Part IX) as well as appropriate revisions.

PROGRAM DEVELOPMENT

The Department of State relied heavily on local, county, regional and State agencies in the preparation of the Coastal Management Program. Under numerous contracts, State and local agencies analyzed coastal resources and provided recommendations which helped to shape the Program and ensure the necessary coordination.

To aid in the preparation of the Program, New York's coast was divided into five coastal regions. Advisory documents were prepared for each region:

- New York City - prepared by the Department of City Planning, City of New York.
- Nassau - Suffolk - prepared by the Long Island Regional Planning Board.
- St. Lawrence River - Eastern Ontario Area - prepared by the St. Lawrence-Eastern Ontario Commission.
- Hudson River Valley (including the Westchester County shore of Long Island Sound) - prepared by the New York State Department of State.
- Great Lakes West - prepared by the New York State Department of State.

These regional reports were used in the preparation of the Coastal Management Program. Many of the recommendations on policies, boundaries, special areas of concern, and implementation have been incorporated into the State's Program and will provide a framework for developing coastal programs at the local level.

SECTION 2 – COASTAL REGIONS OF NEW YORK: RESOURCES AND CONCERNS

INTRODUCTION

New York is unique among the coastal states. No other State encompasses three distinct coastal environments within its borders: the marine environment of Long Island and New York City; the tidal estuarine environment of the Hudson River; and the freshwater environment of the Great Lakes-St. Lawrence region. This richness of resources brings with it, however, a distinct complex of problems.

There are no common solutions for these three coastal environments. Both the Great Lakes-St. Lawrence and the Long Island regions, for example, are faced with serious erosion problems along portions of their coast. However, climatic conditions, land configuration, soil structure, and shoreline recession rates in each region differ so that solutions proposed for one region are not transferable to the other. Changing water levels mark both the freshwater environment of the Great Lakes-St. Lawrence and the marine environment of New York City-Long Island, but extreme tidal fluctuations and period differentials between freshwater inflow and outflow create additional concerns. While these problems may seem at times insurmountable, New York's Coastal Management Program provides an opportunity to devise ways not only to preserve but to enhance the environment in which its residents live and work. Distinctive characteristics and principal concerns of the State's three different coastal environments are identified in the following discussion.

MARINE COAST OF LONG ISLAND AND NEW YORK CITY

Long Island

Long Island is a detached segment of the Atlantic Coastal Plain, separated from the mainland on the north by Long Island Sound and from Manhattan on the west by the narrow East River and New York Harbor. The Atlantic Ocean completes the Island's salt water encirclement. The Island is 120 miles long, varies in width from 20 miles to less than a mile, and is surrounded by a shoreline (including barrier islands) of approximately 1,475 miles, 46% of New York State's designated coastline.

The last continental ice sheets retreated from Long Island and elsewhere 10,000 years ago, leaving behind unconsolidated, highly erodible glacial materials. Since then, rising sea levels have shaped the Island's rough outline. Today, littoral forces of wind, wave, and tide constantly reform the coast. About once every two years, storms cause moderate damage to properties along the shoreline, and approximately three times a century a catastrophic storm rips over the Island. In a few hours severe storm conditions can alter the shore as much as normal conditions do in a hundred years. Thus, shoreline recession is a variable process, depending mostly on the frequency and severity of storms.

The north shore of Nassau County erodes at a rate of one half foot to a foot per year, and Suffolk County's north shore erodes at an even faster rate. Despite such vulnerability, people have continued to build all along this fragile shoreline. In order to protect shorefront property, it has been the practice to construct jetties, groins and seawalls and to nourish beaches. These measures, however, tend to be effective only in a limited area and may actually cause serious problems in adjacent areas.

West of Port Jefferson is a highly irregular configuration of deep harbors and bays separated by peninsulas projecting into Long Island Sound. Sand and gravel eroded from the peninsulas have been deposited as

spits (e.g. West Beach on Eaton's Neck) and bay mouth bars (e.g. Old Field Beach at Port Jefferson). East of Port Jefferson, a line of uninterrupted bluffs rising as high as 130 feet extends all the way to Orient Point. Erosion rates of these bluffs range from 0.8 to 5.2 feet a year.¹

The Island's south shore includes two distinct physiographic features: an eastern headlands section on the Island's south fork and an off-shore barrier complex. The eastern headlands section, extending 33 miles westward from Montauk Point to South Hampton, is characterized by truncated hills of varying heights and steepness. Fronted by narrow beaches of gravel and coarse sand, these headlands have suffered severe erosion.

The barrier complex stretches parallel to Long Island for 73 miles west from Southampton to the Nassau County-New York City boundary. Fire Island National Seashore and Jones Beach State Park and other recreational areas are found on these formations. Consisting of ocean beach, irregular sand dunes and bayside tidal lagoons, these narrow islands are continually subject to the action of waves, wind and westward long shore currents. Most important, these barriers receive the brunt of severe storms and protect the bays and "mainland" from storm damage.

In addition to the loss of land through erosion, valuable land resources on Long Island have been absorbed in the rapid population expansion from west to east. Although Suffolk County remains today the most productive agricultural county in New York State in terms of value of products sold, most of the farmland in Nassau and western Suffolk Counties has been developed, either for residential, commercial, and industrial purposes, or utilized for transportation services.

The salt marshes and meadows of Long Island are highly productive fish and wildlife habitats. They also serve as pollutant filters and as natural buffers dissipating the energy of storm waves. However, during the period 1954-1964, these multiple values were often overlooked as 8,200 acres of marshland in Nassau and Suffolk Counties were filled in for residential, recreational, industrial and related development. This ten-year period saw somewhat greater losses in Nassau County (33 percent of the total 1953 acreage) than in Suffolk County (17 percent of the total).²

A tidal wetlands trends analysis was conducted by the New York State Department of Environmental Conservation in Suffolk and Nassau Counties from 1974 to 1999, and again by the New England Interstate Water Pollution Control Commission (NEIWPC) in Long Island estuaries in 2015. The NEIWPC analysis looked at trends through to 2005/2008. In that time period, Long Island's estuaries lost 13.1% of native tidal wetlands (intertidal, high marsh, and coastal fresh marsh) along the coast between 1974 and 2005/2008. Collectively, Long Island's three estuary complexes--Long Island Sound Estuary, South Shore Estuary, and Peconic Estuary--lost 2,714 acres of native marshes, an average of 87.5 acres of native marsh each year. Losses occurred for one or more of the following reasons: wave energy, erosion, sand accretion, sediment budget disruption, subsidence, dredging and sea level rise. The NEIWPC trend analysis showed indicators of marsh drowning or waterlogging, which may be due to the interacting effects of the failure of marsh accretional processes to keep pace with relative sea level rise and marsh subsidence.³ A 2012 study by the U.S. Fish and Wildlife Service calculated total tidal wetland and non-tidal wetland loss on Long Island between 1900 and 2004, and found that Nassau and Suffolk Counties may have lost almost 39,000 acres or about 48 percent of its wetlands since the early 1900s. Of that, about 3,500 of lost acres were beaches (27% loss), 11,798 of lost acres were freshwater (nontidal) wetlands (54% loss), and nearly 24,000 of lost acres were tidal marshland (50% loss).⁴

Increased development has also put added stress on the Island's groundwater aquifer, its sole source of potable water. Since the aquifer is vast and continually replenished, the overall quantity and quality of Long Island's underground water supply is satisfactory. However, a greater demand for water from the western end of the aquifer has created an east-west imbalance in the system. Failing septic tanks in natural aquifer recharge areas threaten to elevate nitrate concentrations in the groundwater.

Stormwater runoff is another development-related problem affecting the groundwater supply. Recharge basins have been built throughout Long Island to retain this runoff and filter it back into the aquifer. Now, trace levels of toxic chemicals from lawns, roads, parking lots, industrial sites and other areas have been detected in some parts of the aquifer. Stormwater may require treatment to remove those chemicals.

Although the overall condition of Long Island's marine surface water is good, human uses of the coast cause localized degradation. Surface waters in and adjacent to highly developed areas are impacted by nitrates and BOD (biochemical oxygen demand) from municipal sewage treatment plants. These point sources of pollution contribute over 70% of the total internal loading of nitrogen in such areas as Manhasset Bay, Hempstead Harbor and Hempstead Bay in western Nassau County, and Flanders Bay in eastern Suffolk County. Generally, sewage treatment plant effluents are not considered a major source of bacterial (coliform) contamination of surface waters, unless the plants are outmoded, as in Hempstead Bay. There are relatively few industrial discharges to surface waters on Long Island and those that do occur (e.g., in Glen Cove Creek) have only localized impacts.

For certain areas, non-point sources of pollution carried by stormwater runoff, stream flow, and groundwater underflow are the major contributors of pollutants to surface waters. Areas where non-point sources are the major contributors include Oyster Bay and Port Jefferson harbors on the north and Great South Bay and Moriches Bay on the south. On-site sewage disposal systems (septic tanks and cesspools), landfills and scavenger waste treatment facilities, and fertilizers contribute directly to surface water quality by contaminating streams and groundwater with nitrates and other soluble pollutants. Urban stormwater runoff contributes coliform bacteria to most surface waters and has necessitated the closing of large areas to shell fishing. Wastes from waterfowl populations and domestic animals on the Island's east end are collected in runoff and further degrade surface waters. Finally, development-related erosion, dredging and dredge spoil disposal add particulates and other pollutants to coastal waters. In addition to local point and non-point sources, pollution from New York City also affects the quality of Long Island's surface waters.

Offshore, a potential for additional pollution exists with Outer Continental Shelf oil exploration and related activities. Based on United States Geological Survey estimates, there is a 59% chance of one to four spills of greater than 1,000 barrels over the life of North Atlantic field operations. Tankers using the Nantucket to Ambrose traffic lanes could endanger the Island's barrier beaches as well.

Water quality problems may also affect the Island's important commercial fishing industry. Total landings of fish (finfish and shellfish) reached a peak of 31,000 metric tons in 1938, continued high for a decade, and declined steadily to about 15,000 metric tons in the late 1970's. In 2013, New York State's total commercial fishery landings equaled 14,949 metric tons worth \$55.9 million, and in 2014, the total landings equaled 11,798 metric tons worth \$53.8 million. New York State's historical record commercial fishery landing was in 1880 with 167,500 metric tons.⁵ This decline may have been caused by a combination of factors such as deteriorating water quality, overfishing, manmade environmental changes, and natural fluctuations.

Nonetheless, the water surrounding Long Island continues to be a permanent or seasonal home for a wide variety of finfish and shellfish. Although certain species of finfish are present throughout the year, seasonal migrants tend to dominate the fish population. The important deepwater species are found primarily on the southern side of the Island and also in the vicinity of Block Island Sound, Montauk Point and Georges Bank. Of all shallow water species landed in 1978, hard clams accounted for the greatest tonnage and dockside value. They were found primarily in Great South Bay. Oysters and scallops were harvested primarily in the Gardiner-Peconic Bay area.

Not only do the vast expanses of water surrounding Long Island support commerce, they also constitute an extensive recreational resource serving residents of the entire New York metropolitan region. Public access, as well as good water quality, is essential to the enjoyment of coastal waters. The Fire Island National Seashore, seventeen State parks, and numerous county, town and private recreational areas provide access to coastal waters. In Nassau County, despite great development pressures, extensive lands have been set aside for recreation uses: 3,234 acres are federally-owned, 5,261 State-owned, and 5,315 county-owned. In Suffolk County, where development pressures have been less, there was an opportunity to bank many more acres of parkland in anticipation of growth: 3,391 acres are federally-owned, 18,545 State-owned and 14,787 county-owned.⁶ Still, the Island will require additional recreational capacity over the next 25 years, not so much to meet new demand as to relieve current pressures.

New York City

Each of New York City's boroughs is situated on an island, with the exception of the Bronx which is part of the continental land mass. The topography of these islands range from abrupt rocky outcroppings in linear patterns, such as those found in northern Manhattan, to steep slopes of unconsolidated glacial material in random clusters which level out on the edges of the island, finally ending in wetlands and beaches.

Throughout the City's history, its land has been intensively used. Surface conditions have been radically altered by excavation, filling, construction and paving. The extent of wetlands has been significantly reduced and natural drainage patterns altered in many cases as filling activities extended the City's land area. Yet, with all these alterations, the general physiography remains predominantly as it was determined by geological formation and other forces.

The Hudson River flows along Manhattan's western shore carrying water from the distant Adirondack-Mountains. It is a tidal estuary, as are all the straits surrounding this island. Fresh water laden with nutrients mixes with salt water in these estuaries to create an ideal environment for a wide variety of plant and animal species. Jamaica Bay, an estuary with associated wetlands, is a major spawning ground for finfish and crustaceans as well as a habitat for at least 200 species of birds.

New York Harbor is naturally divided into several parts. The Lower Bay at the entrance to the Atlantic Ocean is connected, via the Ambrose Channel, to the Upper Bay which in turn meets the Hudson River. Forty-two channels run throughout the Harbor. These channels require constant maintenance. Unfortunately, adverse environmental impacts have been associated with the processes of dredging spoil disposal, particularly when the dredged materials are polluted.

During dredging operations, sediments are resuspended and mixed with water, thereby increasing the potential for immediate release of contaminants into surrounding areas. When the dredged sediments or spoils are deposited at an open water disposal site, contaminants may be released slowly into the overlying water column for several years.

Alternate methods for dredge spoil disposal must be developed for the New York City region. These methods include inland disposal, placement behind diked enclosures, and mitigative measures such as capping. However, the shortage of available and suitable onshore disposal sites and the potential leaching of contaminants from such areas into adjacent ground and surface waters make these alternative methods expensive and hazardous.

Other important adverse impacts may result from dredging and disposal activities in New York City's waters. These include changes in bottom topography, local water circulation patterns, and flushing, erosion and sedimentation rates. Biological effects, such as the loss of the aquatic habitats mentioned above, may result from the physical and chemical impacts of dredging.

The potential for oil and hazardous spills is high in New York Harbor due to the substantial amount of commercial shipping. This possibility is compounded by the location of numerous oil and other bulk storage facilities along the City's and New Jersey's waterfronts. While the development of offshore oil and gas production and new energy facilities may contribute to the revitalization of some deteriorating shorefront areas in New York City, the chances for spillage multiply.

Floating debris in the Hudson River and New York Harbor is another serious problem. The debris comes from decaying piers and bulkheads, abandoned ships, and vegetation. It is estimated that the River and the Harbor annually receive over 600,000 cubic feet of debris,⁷ which poses a threat to commercial shipping and recreational craft.

The Port of New York has been the nation's foremost maritime center since the Erie Canal opened in 1825. For many years, the volume of foreign cargo grew tremendously; and industries, associated with or dependent on water transportation, developed along Manhattan's shores.

However, the heyday of New York's port has passed. People and commerce have moved from inner city to suburb, leaving many underutilized, sometimes abandoned, sites along Manhattan's waterfront. New methods of production, increased reliance on the truck for product distribution, need for more space, antiquated physical plants, deteriorating neighborhoods, and spiraling property taxes compounded by the financial incentives provided by suburban counties and other states, are among the reasons for the reduction in manufacturing and commercial activity along New York's waterfront. Revitalization of these areas is the most effective way to encourage economic development without at the same time consuming valuable suburban and rural open space.

Some deteriorating waterfront areas might be redeveloped to meet the recreational needs of New York's seven million residents. Much of the City's outdoor recreation is based on structured activities, with opportunity for less structured relaxation provided along the southern shore in Gateway National Recreation Area and at other smaller sites in all five boroughs. Here, good water quality allows for such activities as swimming and fishing. However, a great many of the City's residents lack adequate means of transportation to outlying parks, are barred from their immediate shore by private development and forced to crowd into the more accessible facilities. Development of recreation sites in deteriorated waterfront areas closer to densely populated residential centers would relieve crowding at existing facilities, provide easier access, and at the same time contribute to an improved economic climate.

More important than inadequate recreation resources for the people of New York City are the basic problems of solid waste disposal, and water and air pollution. Partially treated sewage is discharged into adjacent waters, however new treatment facilities are under construction and existing plants are scheduled

for upgrading. Urban stormwater runoff and combined sewer outflows significantly affect the quality of coastal waters in the New York City.

While many of the critical environmental and economic problems besetting New York City affect areas well beyond its boundaries, the City's vast natural and cultural resources are a boon and creative stimulus not only to the immediate region, but also to the State, the Nation and beyond.

HUDSON RIVER ESTUARY

The Hudson River estuary is a long arm of the sea, extending 150 miles inland. Its present geologic form dates from the period after the last glacier. As the glacier melted, rising seawater moved in and flooded the old course of the river. Today, because it is so large a tidal and navigable river, the Hudson is unique in the northeastern United States.

As an estuary, two major characteristics of the Hudson are its tidal action and its salinity. Up to Troy, the River's flow reverses with the tide, the mean tidal range at Albany being 5.3 feet. The limit of salt water intrusion in the Hudson varies. It is primarily determined by the interaction of the tidal force, which pushes salinity up the estuary, and the freshwater inflow, which flushes the estuary seaward. The limit, therefore, changes with the seasons; during spring runoff, freshwater inflow is greatest and salt water extends not far beyond Yonkers; while in the winter, salt water can extend nearly to Poughkeepsie, a distance of seventy miles.

The history of the Hudson River reflects a strong relationship between the natural environment and the economy. Accesses to the River, water transportation, fisheries, agriculture, and the scenic quality of the area have been major factors in the development of the Valley. These factors, plus the proximity of large population centers, some of which depend on the river as a source of water supply, including the Town of Poughkeepsie, continue to make the Hudson a unique economic and environmental resource for the State, and therefore, are the major concerns of the Coastal Management Program for the Hudson Valley.

The Hudson is an important link in the State's transportation network, being navigable for ocean-going vessels as far as Albany. Beyond Albany, the State Barge Canal provides a system for shallow draft vessels which connects the Port of New York with the Great Lakes and the St. Lawrence River. The Port of Albany is the most diversified of the upstate New York ports. It is a significant economic force in the Hudson Valley because of its location at the center of a large market area with excellent highway and railroad access, a 12-month operating capability, and a strong commitment from both the State and the Albany-Rensselaer business community to see to it that the Port realizes its potential as a shipping and industrial center. Between the Port of New York and the Port of Albany, the Hudson River serves a limited but important group of water-related industries including petroleum, sand and gravel, cement, and gypsum. Without access to the River, these industries would operate at an economic disadvantage. In general, the region benefits from the lower cost of water transportation as compared to land routes. In some cases (particularly gypsum and gravel), the cost savings of water shipment are directly responsible for the location of those industries along the Hudson.

In the mid-eighteenth century, rail lines were built along both sides of the Hudson. For almost the entire length of the east shore, and for half the length of the west shore, these railroads were built directly on the River's edge. Thus, railroads have severely limited access to the Hudson. However, the railroad must also be seen as essential to economic life in the State. It should also be noted that while the railroads have limited

physical access, they have also served to prevent other development of the shore which might have had greater adverse impact on the quality of the coast.

The Hudson River is inhabited by an extraordinarily rich variety of fish species. Some of the best known are diadromous forms, those fish which spend part of their life cycle in freshwater and part in salt water. Among the important diadromous species are the American eel, shad, alewife, striped bass, and sturgeon. Two species of sturgeon, shortnose sturgeon (*Acipenser brevirostrum*) and Atlantic sturgeon (*Acipenser oxyrinchus*) are found in the river. The former is a listed endangered species. Indeed, the River is one of the major spawning grounds for several commercially significant Atlantic species, particularly striped bass. In the past, commercial fishing in this estuary was a viable industry. However, fishing activity has been reduced because of the sharply increased pollution, the unpredictability of the catches, and changing social conditions. While the quality of its waters has improved through treatment of municipal wastes, past discharges of toxic wastes still contaminate the River. Because of this toxic pollution, all commercial fishing in the River below Troy is banned except for shad, goldfish, and large sturgeon. Within this estuary and its immediate environs, there are many important wildlife habitats, particularly the numerous wetlands which are used by migratory waterfowl and other forms of wildlife.

The Hudson Valley is an important fruit growing area. Orchards in Columbia, Ulster, Dutchess and-Orange counties account for more than a fifth of the value of fruit grown in New York State. Most of this production occurs close to the River. It is found there because of the way the Hudson and the surrounding landforms have influenced the microclimate. The area's greatest concentration of orchards is found in southern Ulster County and northern Orange County. Microclimate and soil conditions make these orchards among the most productive in New York. It is in this area also that the Hudson Valley's best vineyards and wineries are found. This is a small but significant industry with a long history and a strong potential for growth. The agricultural land in the Hudson Valley is under pressure for conversion to other uses. However, reflecting a local concern for preserving farmland, most of the important coastal agriculture now lies within agricultural districts.

The Hudson Valley coastal region is one of the most outstanding scenic attractions of the United States. Its scenery includes the dramatic vertical rise of the Palisades at the lower end, beautiful views of the Catskills along its upper reaches, the magnificent Hudson Highlands which rise straight from the water's edge, long stretches of farms and historic estates, and a scattering of urban waterfronts. The outstanding scenic resources of the Hudson Valley inspired one of the most significant and first truly American schools of painting. Most of the scenic area in the Hudson River Valley is in public ownership, notably that land owned by the Palisades Interstate Park Commission. In the Highlands, much scenic land is either in State parks or occupied by the U.S. Military Academy. However, significant areas of these scenic resources are not in public ownership and are not protected.

Because the Hudson River can provide large amounts of water for cooling purposes, energy production facilities have been located along its banks. Numerous proposals for additional facilities, mostly nuclear, have been made and have engendered much controversy over their potential impact on existing industry, fisheries, agriculture, and the scenic quality of the region.

GREAT LAKES - ST. LAWRENCE REGION

The Great Lakes - St. Lawrence area has the most diverse shoreline of New York State's three coastal environments. Although the area has problems common to the State's other coastal regions, there are

additional concerns unique to this area, which includes the State's second and third largest cities and its principal heavy industrial center. Its borders encompass the vast freshwater bodies of Lake Erie, the Niagara River, Lake Ontario, St. Lawrence River and internationally renowned scenic resources of Niagara Falls and the Thousand Islands.

The mainland coast of the Great Lakes area extends for over 700 miles. When 340 miles of island shoreline - located mostly in the two rivers - are added to this mainland frontage, New York's Great Lakes - St. Lawrence coastline comprises about one-third of the State's entire coast. The greater areal extent is represented by its waters - approximately 4,000 square miles. Onshore, the area of the 78 communities which are located along the coast totals almost 3,000 square miles.

The coastal lands lie in the Erie-Ontario Plain and in the St. Lawrence Marine Plain, areas of generally low relief broken only by drumlin formations along sections of eastern Lake Ontario. Despite the absence of significant variations in the relative altitude of landforms along the coastline, there are many prominent topographic features which give the area a unique character. In addition to Niagara Falls and the Thousand Islands, which attract millions of visitors each year, those features include: the Genesee River gorge; embayment, such as Braddock Bay, Sodus Bay and Henderson Bay; and the area's only dunes which stretch for five miles along the eastern shores of Lake Ontario.

Particularly significant topographic forms are the bluffs found along a substantial portion of the coasts of Lake Erie and from Niagara to Oswego County on Lake Ontario, rising in many places to over 120 feet in height. These bluffs provide superb vantage points for sweeping views of the coast, an amenity which is prized by tourists as well as shoreline residents. However, the bluffs also severely limit access to the shores and to the waters of the coast. This means that the multifaceted relationships between land and water found in other regions are lacking along much of this Great Lakes coast. Because of the single dimension of the coastal experience in most of these bluff areas, and the lack of viewing points further inland owing to the flat land configuration, connection with the coastal waters fades quickly as one moves away from the shore's edge. Another characteristic of the Great Lakes coast is the scarcity of wide beaches, even when the lakes are at their average levels. This is due principally to the absence of suitable beach-building materials.

The waters of the area's lakes, rivers and tributary streams constitute one of the State's most valuable fisheries. Because of previous over-exploitation, water pollution, destruction of habitats and introduction of certain non-native fish, many valuable species, such as lake sturgeon (*Acipenser fulvescens*) and Atlantic salmon, became virtually extinct. In recent years, because of intensely focused fishery management practices such as the salmonid stocking program, many species highly prized by fishermen have been on the increase. Numerous fish habitats of significance are located throughout the area and include: Cattaraugus Creek; Strawberry Island in the Niagara River - a major spawning ground for muskellunge; Eighteen Mile Creek in Niagara County which serves as a spawning habitat for salmonids, northern pike and smallmouth bass; Oak Orchard Creek in Orleans County; Braddock Bay, a major wetland complex which supports bass and perch populations; the embayment habitats of Wayne and Oswego counties; the renowned fishery in the Salmon River; the northern pike fishery which extends from Henderson Harbor through the Thousand Islands; Chaumont Bay which provides not only sport but commercial fishing opportunities; and, Cranberry Creek Marsh on the St. Lawrence River. The area's fishing resources not only offer fine recreation to the residents of the coastal communities but contribute to the region's economic life by attracting large numbers of sports fishermen from both the United States and Canada.

The Great Lakes - St. Lawrence region has a wide array of opportunities for waterfowl hunting, or simply observation of hundreds of species including such rare birds as bald eagles, double-crested cormorants and red phalaropes. Of special note is the location of much of the area in the "flyway" used by thousands of migrating birds each year. These important fish and wildlife resources are located not only in rural communities but in or near urban centers such as Buffalo and Rochester.

Unfortunately, these valuable natural resources continue to be subjected to intense pressures. Toxic substances released into the area's waters have been found in certain Lake Ontario fish. Wetlands, streams and other habitat areas are endangered by development which directly interferes with the life cycle of species or lowers water quality below that necessary for their optimum production. In many places, access to harvest or to observe those species is limited.

Erosion is a regional problem, but it is more severe on Lake Ontario and on sections of the St. Lawrence River, because the shorelands there are composed mainly of vulnerable glacial soils. As the land is undercut, buildings gradually topple onto the beaches or into the water. Many structures, built at great expense to protect the shore, prove to be inadequate; in some cases they have caused erosion of adjacent lands. The financial losses incurred directly and indirectly by both public and private interests are substantial.

The Great Lakes - St. Lawrence area differs from the Hudson River and the marine coast in one important respect -- its waters are not subject to tidal movements. However, the levels of Lake Erie and Lake Ontario respond first to inflows not only from their own drainage basins but also from Lake Michigan, Lake Superior and Lake Huron, whose waters eventually reach the sea through the St. Lawrence River. Water levels are also affected by the speed with which waters can flow down from Lake Erie and Lake Ontario. In the case of the former, the depth of Niagara River's existing channel limits the rate of outflow. Because Lake Erie in recent years has been at a level higher than the long-term average, studies are under way to determine the feasibility of changing the Niagara River's channel configuration to allow more water to escape from the Lake. On the other hand, Lake Ontario's outflow channel, the St. Lawrence River, was modified in 1958 so that the Lake's water level could be managed for three purposes: to allow deep draft ships to enter Lake Ontario from the sea; to provide for the operation of hydro-electric power plants; and, to permit a greater outflow from the Lake. In 1973, a severe storm, occurring during a period of very high water level, caused extensive damage to shoreline properties. Since then, coastal residents, fearful of the continuing high levels, have criticized the International Joint Commission for failing to take their interests into account.

Recreation is a major concern in the area, not only as to the extent of the resources but also their quality and the public's accessibility to them. State, county and local governments and the private sector are all suppliers of such resources. Forty State parks line the shores, placed to take advantage of such features as: scarce wide sand beaches on low-lying lands, as at Lake Erie State Park, Evangola State Park, Hamlin Beach and Selkirk Shores; areas of high scenic quality, as can be viewed from the cluster of State parks around Niagara Falls and the river gorge; and the unique juxtaposition of land and water in the Thousand Islands region where several State parks are sited. County and municipal parks and facilities, and those owned by private interests add considerably to the region's total number of recreational resources. Despite this abundance, a number of problems remain. In the urban areas of Buffalo and Rochester, there are still pressing needs for swimming, boating and fishing opportunities. In some instances, resources exist, but because of poor water quality, swimming is precluded. In Buffalo and in other places, highways block access to shorelands, thereby reducing the opportunities for residents to enjoy their coastal resources.

The anticipated expansion of interest in boating will impose greater demands on existing facilities in the region which are not sufficient to satisfy needs in many areas, particularly on Lake Erie and Lake Ontario where the fisheries are attracting great attention. More harbors of refuge are required, because of the larger number of smaller craft being used by fishermen and the dangerous storms which can arise very quickly on both lakes.

The residents of the Great Lakes - St. Lawrence area also share a major concern with those of other coastal regions: how to bring new life to the often abandoned, and run-down, waterfront sections of their communities, both large and small. This concern reflects a growing recognition of the unrealized economic and social potential of ports and harbors, such as Buffalo, Rochester, Oswego and Clayton, which served in the past as mainsprings for the area's development. The challenge is to revitalize those waterfront locations in a balanced way and thus restore them to their historic role as major contributors to the well-being of the region.

SECTION 3 – COASTAL BOUNDARIES

INTRODUCTION

The Coastal Management Program has established statewide boundaries in accordance with the requirements of the Coastal Zone Management Act of 1972, as amended, and its subsequently issued rules and regulations. This was not a simple task; New York is unique among the coastal states in the diversity of its “coastal areas” and “coastal waters.” As indicated previously, the State’s Coastal Area is comprised of distinct sectors: Long Island, a land mass fronting on the Atlantic Ocean, which exhibits strong land and water interrelationships; New York City, where the intensity of land and water uses is the greatest in the State; the Hudson River Valley, with a unique estuary that extends 150 miles into upstate New York; and the Great Lakes - St. Lawrence River region, which contains a vast non-tidal freshwater coastal system.

The Coastal Zone Management Act and the federal rules and regulations pertaining to it define a number of general and specific requirements that must be followed in determining statewide coastal management boundaries:

1. A determination of the inland boundary necessary for the management program to control shorelands, the use of which has a direct and significant impact on the coastal waters;
2. A determination of the extent of the territorial sea, or, where applicable, of State waters in the Great Lakes;
3. An identification of all federally-owned land or lands which are held in trust by the federal government, its officers and agents in the coastal area and over which the State does not exercise any control as to use;
4. An identification of tidal and saline waters, transitional and inter-tidal areas, salt marshes, wetlands, and beaches; and;
5. A process for consultation with adjoining coastal states so as to minimize the possibility of incompatible uses occurring at boundary junctures.

Both State and local agencies provided input to the definition of New York’s Coastal Area. Regional and municipal planning agencies mapped in sketch form an initial coastal boundary, employing guidelines developed by the Department of State. The Department of Environmental Conservation, under contract with the Department of State, proposed a statewide boundary determination process based upon work performed during the initial phase of the program by the various agencies. The Department of State summarized the initial boundaries which were developed and recommended by the local agencies. The recommended boundaries were delineated on maps at a scale of 1:24,000.

BOUNDARY CRITERIA

Following this preliminary work, the Department of State adopted a set of boundary delineation criteria which were in accord with the federal requirements and also recognized a variety of State and local concerns. These criteria, outlined below, were employed in defining the final coastal boundary:

1. **Utilize a one-tier boundary rather than a multiple-tier concept.** Despite proposals by several jurisdictions for a multiple tier approach to boundary definition, the single tier boundary was adjudged to provide for simpler administration.
2. **Conform with the nearest cultural feature or political boundary.** Employment of recognizable or known land-marks such as a road, railroad, utility right-of-way, or municipal boundary as the onshore feature to delineate coastal boundaries permits speedy determination as to whether a particular parcel of land lies within the defined coastal boundary. Unless otherwise indicated, the shoreward side of a road, railroad or other right-of-way is to be considered the boundary line.
3. **Include all land and water uses directly impacting coastal waters.** The boundary encompasses all those “land and water uses of direct and significant impact on coastal waters” specified in the Coastal Zone Management Act. Such impact is defined as that which changes the physical, chemical, biological, littoral, or aesthetic characteristics, or the socio-economic values of coastal waters to the extent that the character, use or availability of its resources and/or the environmental quality standards of the coastal waters are so adversely affected that they can only be maintained or restored at high cost to society.
4. **Include any specially designated management areas.** These comprise State parks along the shore, and areas for which a local waterfront revitalization program has been approved by the Secretary of State, and areas designated as estuarine sanctuaries.
5. **Include tidal and saline waters, wetlands, islands and beaches.** The State’s Coastal Area includes all coastal waters which, as defined by the Waterfront Revitalization of Coastal Areas and Inland Waterways law, include “lakes Erie and Ontario, the St. Lawrence and Niagara rivers, the Hudson river south of the federal dam at Troy, the East and Harlem rivers, the Kill von Kull and Arthur Kill, Long Island sound, and the Atlantic ocean, and their connecting water bodies, bays, harbors, shallows and marshes.” All barriers and other islands situated in these waters are within the coastal boundary. Also, significant portions of creeks, streams and rivers which are tributaries to these coastal waters are found within the Coastal Area.
6. **Exclude present federally-controlled lands.** The federal legislation specifies that such lands be identified and then excluded from the boundary. All federal lands and facilities situated in New York’s Coastal Area are listed in Appendix D. Major land holdings are delineated on the Coastal Area maps.
7. **Provide buffer areas, where appropriate.** Where desirable for aesthetic or other reasons, a landward buffer area of up to 1,000 feet from an identified political/cultural feature is provided, where otherwise the feature itself would serve as such boundary.
8. **Coordinate boundary lines with those of adjacent states.** Such action is necessary to avoid incompatible use conflicts at the juncture of New York’s coastal boundary with those of Connecticut, New Jersey, and Pennsylvania. Throughout the development of New York State’s Coastal Management Program, discussions were held and information was exchanged with officials from neighboring coastal states regarding the location of the coastal boundaries. It was determined that no major conflicts would arise due to any differences in the location of the inland boundaries at the borders of the respective coastal states.

9. **Incorporate, to the greatest extent possible, local agency recommendations.** Preliminary boundary proposals made by local agencies provided a basis for final boundary determination, although some modifications were made to incorporate one or more of the preceding criteria.

SPECIAL ACCOMMODATIONS

The following were additional concerns, reflecting existing State policies and local circumstances which were recognized in the final landward boundary delineation:

1. **Agricultural lands** - The boundary was extended inland to include certain areas of coastal dependent agriculture where that use was very intensive, covered a large contiguous area and there was a clear inland boundary, i.e., a change in land use.
2. **Viewsheds** - Efforts were made to include within the boundary those avenues of visual access to the shore from public viewing points such as roads and public recreation areas. The ridgeline that defined the limits of what could be seen, for example, from the Hudson River or its shore was used to include the most scenic areas, primarily the Hudson Highlands and the Palisades.
3. **Power Plant Sites** - All existing steam-electric generating facilities of 50 megawatts or more, all sites for which application has been made to the State Siting Board to construct such a facility and all hydroelectric facilities, if coastal waters are used for cooling or generation purposes, were included within the coastal boundary. If a site for which application has been made is rejected by the State Siting Board, the boundary will be re-evaluated according to the boundary criteria listed above.
4. **Historic Sites** - Those historic sites which have a close association with the history of New York's coast were included. Also included were small coastal villages with historic relationships to the coastal waters.
5. **Industrial areas** - All areas of coastal-dependent industrial activity and areas with known adjacent to existing coastal dependent industrial areas.
6. **100 Year Flood Line** - The area encompassed by this line, as identified by the Federal Emergency Management Administration under the National Flood Insurance Program, is the area most directly affected by the dynamics of the coastal process. Where the 100 year flood plain is clearly coastal related, it is included within the boundary. This flood line is a significant boundary determinant on many of the downstream segments of creeks, around embayments and along the shoreline itself.
7. **Coastal Recreation Areas** - Those recreation areas that are not State parks but are on or near the coast were included within the boundary. These areas include municipal and county parks and beaches, fishing and boating access sites, and campgrounds.

It should be noted that the above were not rigidly applied; in some areas additional specific information from counties, citizen groups, and other sources was used in determining boundaries.

Figures 1-4 illustrate the application of the boundary criteria and special accommodations at various locations in the State's Coastal Area.

NEW YORK STATE COASTAL AREA

Landward Boundary

Generally, boundary proposals made by local government agencies form the basis for the delineation of New York's landward coastal boundary. Understandably, modifications were necessary where local recommendations did not satisfy the criteria established for the statewide approach. Where a local agency could not agree on a boundary proposal, the Department of State developed the boundary line in accord with the indicated criteria.

As a result of the above process, the landward boundary of New York State's Coastal Area varies from region to region. Generally, the following conditions prevail:

1. The inland boundary is approximately 1,000 feet from the shoreline of the mainland.
2. In urbanized and other developed locations along the coast, the landward boundary is about 500 feet from the mainland's shoreline or less than 500 feet at locations where a major roadway or railroad line runs parallel to the shoreline.
3. At locations where major State-owned lands and facilities and electric power generation facilities about the shoreline, the boundary extends inland to include such lands and facilities.

In the Long Island region, the State's Coastal Area includes all barrier and other islands which are situated in coastal waters. On the mainland, the landward boundary is generally 1,000 feet from the shoreline, however, at major tributaries and headlands it extends several thousand feet inland. Along the Long Island Sound Coast of Westchester County, the boundary extends 1,000 to 8,000 feet inland.

In New York City, this boundary extends 500 to 1,000 feet inland at most locations. However, on Staten Island and along major tributaries, such as the Bronx River, Newtown Creek and Flushing Creek, the landward boundary is several thousand feet from the mainland's shoreline.

Throughout most of the Hudson River Valley region, the landward boundary is generally 1,000 feet, but at some locations over 10,000 feet, from the River's shoreline. The latter occurs at places which are exceptionally scenic (for example, Hudson Highlands) or have significant agricultural and recreational lands.

Finally, the Coastal Area in the Great Lakes region of the State is about 1,000 feet inland from the shoreline. However, in many of the urbanized and developed areas of the coast (for example, Buffalo, Rochester, Oswego, Alexandria Bay and Ogdensburg) and at several locations where State highways and rail lines parallel the shoreline, the boundary extends 500 feet or less inland.

Seaward Boundary

The federal requirements regarding the seaward boundary are explicit. The State's Coastal Area must include all coastal waters that are within its territorial jurisdiction. In accordance with these requirements, the Department of State has established the following seaward boundaries:

- **Great Lakes - St. Lawrence Area** - Beginning at the Lake Erie Pennsylvania/New York line, the boundary follows the international boundary through Lake Erie, the Niagara River, Lake Ontario and the St. Lawrence River to that point where the St. Lawrence River leaves the United States.

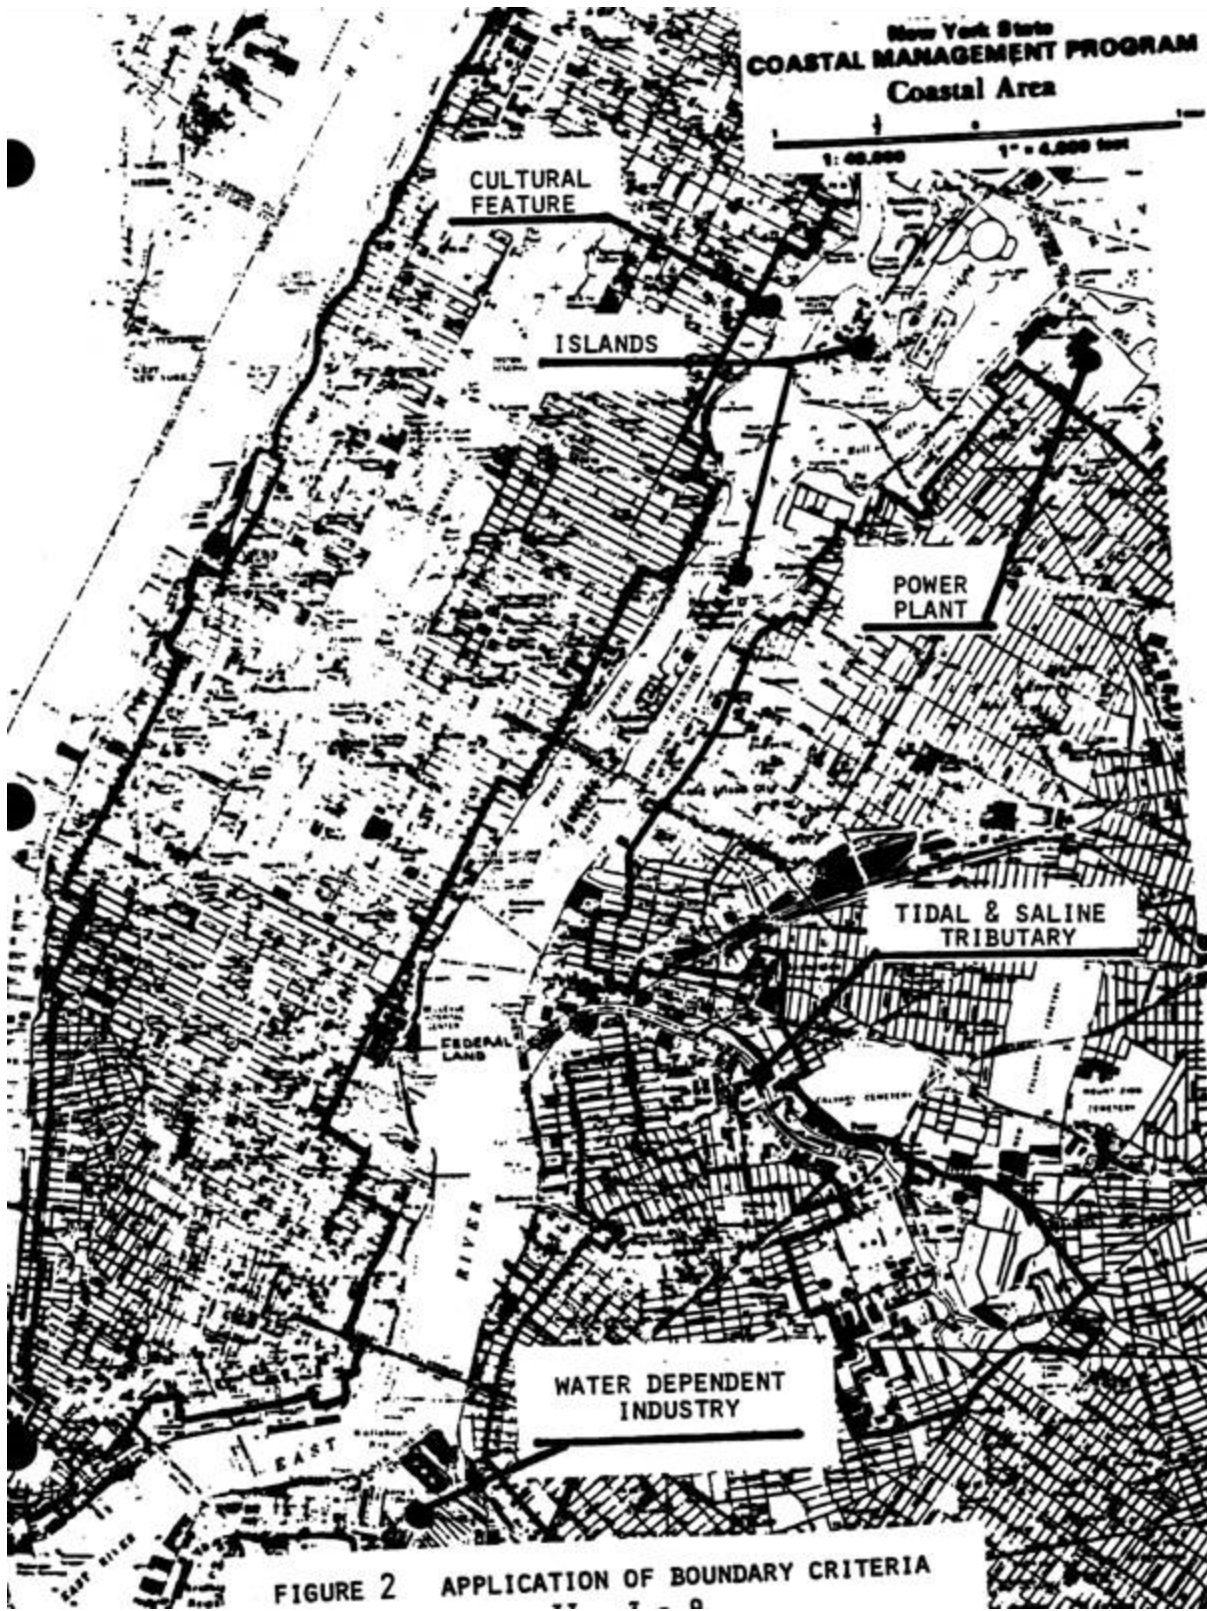

- **Atlantic Ocean Area** - Beginning at the New York/New Jersey line, the boundary follows the State boundary in the Hudson River, Upper Bay, Arthur Kill and Raritan Bay to the three-mile limit of the territorial sea in the Atlantic; follows the New York/Rhode Island boundary in Block Island Sound and the New York/ Connecticut boundary within Long Island Sound.

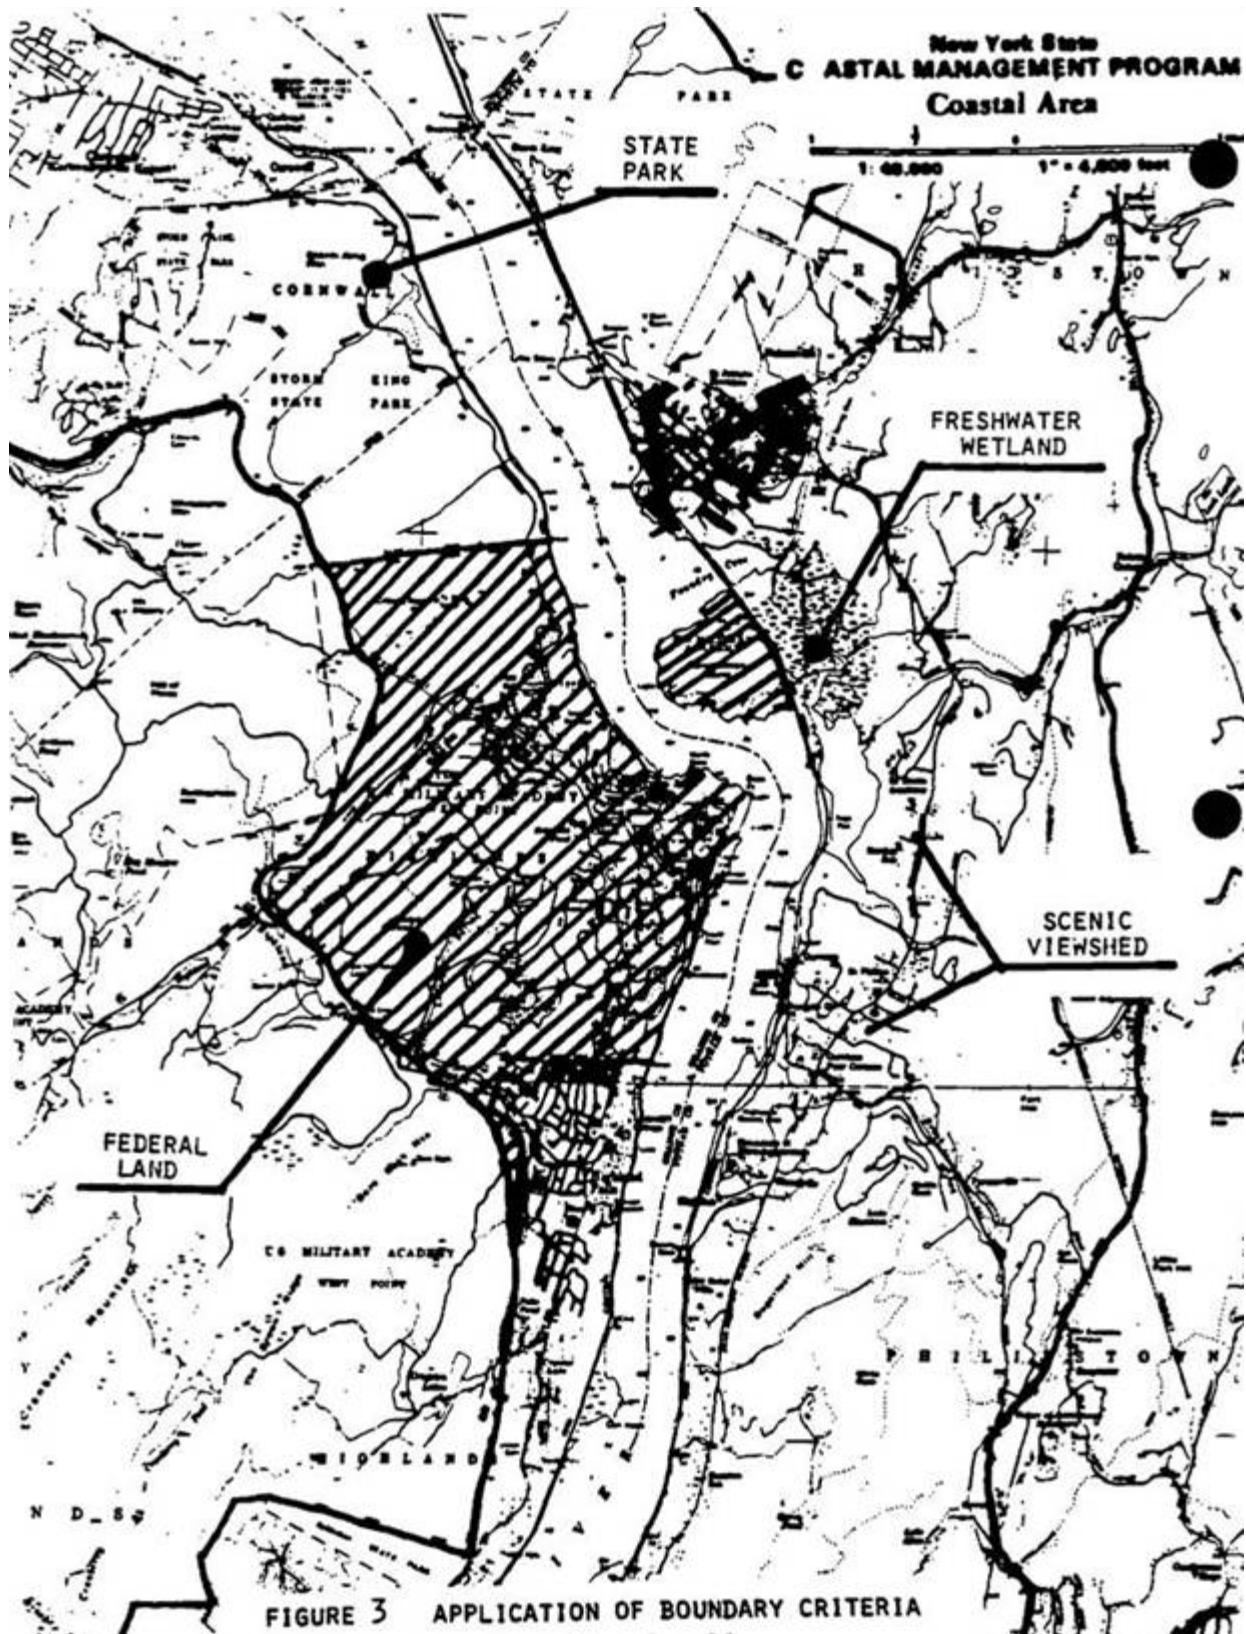

Mapping

As indicated above, a set of maps, presenting the entire Coastal Area of New York State at a scale of 1:48,000, has been filed with State agencies. Additionally, appropriate copies of these maps have been filed with the clerks of coastal counties, cities, towns and villages. These maps show the location of the State coastal boundary and major areas of excluded federal lands.

FIGURE 1 APPLICATION OF BOUNDARY CRITERIA

SECTION 4 – PROGRAM MANAGEMENT

INTRODUCTION

New York State’s Coastal Management Program must perform two major roles in order to achieve its overall purpose. One is to coordinate existing programs, activities, and decisions affecting the State’s coast. The second is to advocate specific desired coastal activities. These two functions are supported by regulations promulgated by the federal Office of Coastal Zone Management which require a State’s program to satisfy the following criteria:

1. The management program must contain policies relating to resource protection, land use and development, and governmental processes (15 CFR 923.3).
2. The State must have sufficient legal authority to carry out and assure compliance with the program’s policies (15 CFR 923.40, 923.41 and 923.43).
3. The State must indicate the organizational structure that is to be used to implement and administer its program (15 CFR 923.46).
4. A single State agency must be designated to administer the management program (15 CFR 923.47).

This section addresses all of the above-listed criteria. However, the criteria pertaining to program policies and legal authority are discussed in some detail in Section 6.

In the development of New York State’s Coastal Management Program, several determinations were made in response to the above federal requirements:

1. New York State would, to the greatest extent possible, rely upon existing laws and programs to implement the Program’s objectives.
2. In July 1981, two bills - the Waterfront Revitalization and Coastal Resources Act and the Coastal Erosion Hazard Areas Act - were signed into law. This legislation filled gaps in existing laws and programs, thus enabling the State to have an approvable Program.
3. Comprehensive review processes, such as the Environmental Quality Review (Environmental Conservation Law, Article 8) and Siting of Major Steam Electric Generating Facilities (Public Service Law, Article VIII [no longer in effect]), would be used to determine an action’s consistency with the Program’s policies.
4. Local governments would be encouraged, to develop and implement waterfront revitalization programs, thus participating in the State’s Coastal Management Program.

The above factors were important in shaping the basic framework of New York State’s Coastal Management Program, particularly the State’s response to the federal requirement as to the method for ensuring compliance with the Program’s policies. New York State must clearly demonstrate that the entities (e.g., State agencies) responsible for the implementation of its Coastal Management Program will exercise their authorities in conformance with the Program’s policies.

The Coastal Zone Management Act of 1972, as amended, requires that one of three techniques (or any combination of the three) be used to ensure compliance with a State's coastal policies. New York State's Coastal Management Program utilizes the first two techniques identified by the Act, but primarily, the second technique, "direct State land and water use planning and regulation", because New York already has many regulatory, capital construction and other programs in effect at the State level which address coastal concerns. There are two ways of operating a coastal management program under this technique: 1) to adopt comprehensive legislation that addresses all coastal concerns and requires State agencies to comply with the law's policies; or 2) to "network" existing programs so that when taken together they result in a comprehensive and unified approach for managing coastal land and water uses. New York's Coastal Management Program employs the networking approach, and compliance with coastal policies is ensured by the consistency provision of Article 42 of the Executive Law and the proposed regulations which implement this requirement.

For specific parts of the State's Coastal Management Program, the first technique will be utilized. Essentially, this technique involves implementation by local governments of State-established standards, criteria and procedures. New York State has enacted several laws for the protection and management of particular resources and areas - freshwater wetlands, coastal erosion hazard areas - which authorize the use of this technique. In each case, the State has established criteria and standards that have been or must be incorporated into these local programs prior to implementation by a local government. The State must review and approve such programs and is responsible for assuring that the programs are implemented in accordance with the established criteria and standards. Where non-compliance is found, the State may withdraw its approval of the local programs.

Where local implementation is not approved, the State will continue to rely upon the second technique.

MANAGEMENT ROLE OF STATE AGENCIES

Most State agencies will have a role in the implementation of the Coastal Management Program. The extent of their involvement will vary due to the nature and, in some instances, the geographic jurisdiction of the programs that they operate. Their participation will involve the promotion and coordination of activities which occur within or affect the State's Coastal Area.

Coastal Management Agency

As the designated coastal management agency of New York State (L. 1975, C. 464, 947), the Department of State will be responsible for administering the Coastal Management Program as well as coordinating activities essential to its implementation.

Chapter 464 of the Laws of 1973 authorizes the Secretary to apply for, receive and administer any federal funds which are made available to the State under the Coastal Zone Management Act of 1972, as amended. These Laws also permit the Secretary to enter into agreements with other State, regional, county and local agencies which could assist the Department of State in the administration and/or implementation of the Coastal Management Program.

The Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law, Article 42) requires the Secretary to file, maintain and, when appropriate, amend the Coastal Area map. As discussed in Section 3, this map shows the lands and waters in New York State to which the law's coastal policies apply. The law also charges the Secretary to review and approve waterfront revitalization programs prepared by coastal communities. As part of this review process, State agencies and appropriate county and

local governments will be consulted before the Secretary of State approves any local waterfront revitalization program. In situations where a conflict between a local program and an existing State policy arises, the Secretary must attempt to resolve the difference.

The Department of State will perform other activities which are essential to the State's Coastal Management and Waterfront Revitalization Programs. Monitoring the decisions of State agencies as to the consistency of their proposed actions with coastal policies will be an important administrative activity. The Department will track actions proposed in the Coastal Area through the State Environmental Quality Review Act (SEQRA) process and will evaluate the consistency determinations made by State agencies. When appropriate, the Department will advise the agencies on the consistency of such actions with the coastal policies. The Program-related administrative and implementation activities of agencies under contract to the Department will also be monitored and reviewed.

Changes to policies and boundaries of the Coastal Area require the review and approval of the Secretary of State.⁸ In order to accommodate anticipated sea level rise projections, actual flood lines from coastal flooding events, and concerns for coastal community resilience in the face of climate change impacts, routine minor boundary adjustments may be needed. Minor boundary adjustments that extend the Coastal Area inland from its current boundary to encompass floodplains and flood hazard areas will be based on FEMA's updated maps and projections, and will help to more effectively manage flood hazard threats to protect social, economic, cultural, and natural resources. If appropriate, such boundary changes may necessitate notification, review and/or approval by federal and local governments. Procedures covering amendments to local waterfront revitalization programs are found in the draft regulations pertaining to the Department's review and approval of such local programs.

The Department of State will also be responsible for conducting the federal consistency review process at the State level. Generally, the Department will evaluate major actions proposed in the Coastal Area of the State by federal agencies or by entities requiring federal permits and determine the consistency of those actions with the Program's policies. Specific procedures governing this review process are contained in Section 9 of this report.

Departmental of Environmental Conservation (DEC)

DEC has the major responsibility for protecting the natural resources of the coastal area. This responsibility includes new administrative authority for protecting coastal erosion hazard areas as well as its existing permit authority for wetlands, both tidal and freshwater, and air and water quality.

In its permitting role, DEC reviews most activities that have the potential to impact coastal resources. Those with the potential for significant impact are thoroughly reviewed in connection with the SEQRA process and can be approved only after DEC has found that the activity will be consistent with the policies of the coastal management program. This review will ensure comprehensive implementation of the program with respect to a wide variety of activities.

In addition, DEC is responsible for a number of direct and funding activities, some of which, such as the construction of wastewater treatment facilities, have major consequences for coastal development. The assured consistency of these activities will have major long range beneficial effects on the coastal area.

Other State Agencies

State agencies, including State created authorities, commissions and boards, operate a number of programs which are critical to and may affect the proper management of New York's coastal resources. In addition

to the Departments of State and Environmental Conservation, some of the other agencies include the Offices of Parks, Recreation and Historic Preservation, Business Permits, New York State Energy Research and Development Authority (NYSERDA), and General Services; the Departments of Transportation and Commerce; the Public Service Commission; the Power Authority of the State of New York; and the Port Authorities of Albany, Buffalo, Ogdensburg, Oswego, and New York - New Jersey; and the St. Lawrence-Eastern Ontario Commission. The State's property disposition, acquisition and leasing, capital project construction, financial assistance, regulatory and planning programs cover many land and water activities that beneficially use and adversely affect these resources. Some of the land and water activities affected by the agencies' programs include the construction of highways; acquisition and development of parklands; siting of energy facilities; construction of seawalls, bulkheads, groins and jetties; and leasing of underwater lands. Most of these programs serve singular purposes, but collectively they form an impressive block of State programs which are aimed at the wise use and protection of coastal resources. Thus, agencies of New York State are equipped and are expected to perform a vital role in the implementation of the Coastal Management Program.

The Waterfront Revitalization of Coastal Areas and Inland Waterways law is the basis for bringing together all of the appropriate State agencies programs for the purpose of implementing New York State's Coastal Management Program. Section 912 of the law establishes several general policies applicable to the Coastal Area of the State and provides the legal basis for most of the policy statements contained in Section 6 of this report. The intent of these policies is to provide direction to State agencies when operating their programs in the Coastal Area. These policies cover a range of concerns pertaining to the use and protection of natural and human-made coastal resources, but one significant declaration is "...to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing the loss of marine resources and wildlife, diminution of open space areas or public access to the waterfront, shoreline erosion, impairment of scenic beauty, or permanent adverse changes to ecological systems". This policy sets the tone for New York State's Coastal Management Program, and the objective that State agencies' should strive to achieve in the Coastal Area.

Section 919(1) of the Waterfront Revitalization of Coastal Areas and Inland Waterways law requires that "...actions directly undertaken by State agencies within the coastal area... shall be consistent with the coastal area policies of this Article." This provision of law effectively ties together the programs of State agencies by binding their decision-making actions to the coastal policies. Thus, the assurance that these agencies act in accordance with these policies is provided by Section 919(1). Actions which are not consistent with applicable coastal policies are to be prevented or, where appropriate, modified to an extent that they may be found consistent with the policies. The State agency having jurisdiction over a proposed action is responsible for determining the consistency of that action with the coastal policies. In instances where two or more agencies may have some jurisdiction over a proposed action, each agency is expected to make its own consistency determination. The actions of State agencies must also be consistent, to the maximum extent practicable, with local waterfront revitalization programs which have been approved by the Secretary of State.

Advocacy Role of State Agencies

In carrying out their respective administrative and coordination responsibilities, the Department of State and other State agencies will promote a number of interests that are central to the overall purpose of the Coastal Management Program. These interests include: (1) the revitalization of waterfront areas; (2) the siting of water dependent uses; (3) the protection of significant fish and wildlife habitats, scenic and historic

areas and farmlands; (4) the enhancement of economic and other activities in small harbors; (5) the reduction of damages caused by flooding and erosion; and, (6) the stimulation of research, dissemination of information, and the participation of the public and private sectors on coastal-related activities.

The major vehicle for promoting waterfront revitalization is through the implementation of voluntary local government waterfront revitalization programs. Section 8 of this document details the minimum requirements to be met by local waterfront revitalization programs. The implementation of these programs, once approved by the Secretary of State, is substantially assisted by the requirement that State agencies are to be consistent with the approved programs. In addition, when such local waterfront revitalization programs are incorporated into the State's Coastal Management Program through the amendment or routine implementation processes established by the U.S. Department of Commerce, federal agencies must also be consistent.

In addition to the local government effort, the Department of State, as the Coastal Management agency, will further revitalization by:

- Assisting State agencies in establishing priorities for waterfront projects.
- Investigating and establishing alternative funding and land use mechanisms which would not unduly burden the public or private sector. This would include investigating the feasibility and appropriateness of such mechanisms as simplification of State permits and other similar permits between levels of government, incentive zoning, revolving loan funds, special tax districts, dedication of property taxes, public benefit assessments, sand and gravel mining fees, tax increment financing, and Outer Continental Shelf revenue sharing.
- Fostering interagency involvement in revitalization efforts on a continuing basis.

There are two major vehicles for promoting water dependent uses. First, State agencies are required to avoid undertaking funding or approving non-water dependent uses when such uses would pre-empt the reasonably foreseeable development of water dependent uses. State agencies must also utilize appropriate existing programs to encourage water dependent uses. Second, the Department of State will work with other State agencies responsible for those coastal resources whose proper use could be water dependent. For example, the Department of State will work with the Departments of Agriculture and Markets, Environmental Conservation, and Commerce to determine methods for expanding the State's commercial fishing industry at proper locations, and then work with selected coastal communities that can feasibly increase this industry.

A primary vehicle for protecting significant fish and wildlife habitats is through the authority granted the Department of Environmental Conservation by the Waterfront Revitalization of Coastal Areas and Inland Waterways law. Significant habitats will be identified and mapped on the State's Coastal Area map. In most instances, it will be possible to avoid or mitigate adverse effects of an action through careful timing or conditioning of that action.

Two means will be utilized in the Coastal Management Program's advocacy for scenic areas. The first is through waterfront revitalization programs, described in Section 915. The Department of State will also provide assistance on the usefulness of several approaches available to local governments for increasing the quality of and/or protecting scenic areas.

The second means is through the Department of State's identification of a limited number of scenic resources of statewide significance on the Coastal Area Map. Once identified, State agencies must

determine whether a proposed action could affect this resource. If the proposed action does affect the resource, agencies are encouraged to choose an alternative site for the action. If it is not feasible, special siting and design guidelines are offered which will minimize degradation of this resource.

The Program actively promotes the preservation of all historic and cultural resources which have a coastal relationship, by requiring protection of the area around historic sites, as well as areas of significance. Further, the Program requires State agencies and local governments with approved waterfront revitalization programs to actively seek to restore or revitalize appropriate areas through adaptive reuse.

The Department of State's research efforts will include working with the Office of Parks, Recreation and Historic Preservation to develop additional means of augmenting preservation and development of coastal historic areas.

Important agricultural lands will be identified and mapped on the Coastal Area map. State agencies are required to prevent actions that would result in a significant loss of such identified agricultural lands. Local waterfront revitalization programs are required to protect important farmlands if they are within the waterfront areas.

State agencies are required to consider whether any proposed action would detract from recreational and commercial fishing, ferry services, marinas, historic preservation, cultural pursuits and other compatible activities which enhance small harbor areas and hence make significant contributions to the State's tourism industry. Local waterfront revitalization programs are required to recognize the social benefits of small harbors and ensure their protection. Further, through the programs' research activities, alternative means for effectuating these actions will be sought.

Visual and physical access to and along the shore will be protected and increased, in part through a single coordinated statewide access planning process. This process will result in the identification of a list of the specific access improvement areas to which the State will give priority within financial and legal limits. Local waterfront revitalization programs must also increase access and protect existing access. Various procedures that may be used are discussed in Appendix B.

The damage to property inflicted annually by flooding and erosion in the State's Coastal Area is not only a burden on individual shorefront residents, but on local governments and the State who lose valuable facilities and are called upon to expend substantial sums for the replacement and for the installation of protective structures. The Coastal Management Program's advocacy stance seeks to reduce this ever-increasing economic waste by setting standards for land development and for the protection of natural defenses which reduce the risk of damage in flood and erosion prone areas.

The Department of State has collected and mapped basic coastal resources data. This information will be made available to all State agencies and any local government preparing and/or implementing a local program. The Department will maintain its coastal resources inventory of significant natural resources areas, historic sites, agricultural lands, and areas suitable for water dependent uses. This information will assist State and federal agencies in ensuring consistency of their actions with the policies. It will also serve as a valuable tool to the private sector and government agencies in their development efforts. The Department of State maintains a clearinghouse of existing and potential federal and State funding programs available for waterfront revitalization and a compendium of various approaches suitable for waterfront revitalization.

The Department will work with Sea Grant to assist in determining research priorities which will serve the purposes of both programs. It will also work with State research and development agencies to establish alternative means of effectuating waterfront revitalization, and protecting significant coastal resources.

The Coastal Management Program will continue providing information to raise the level of public awareness of coastal issues and opportunities, and will continue seeking advice from affected interests and government agencies in the decision-making process. The Department of State will periodically conduct workshops with State and federal agencies to review the performance of the Program, resolve differences, and make improvements. Workshops will also be held with environmental, development and other interests to ensure the Program is meeting its objectives and addressing the problems of concern to these interests.

The voluntary waterfront revitalization programs are based on building a consensus between all affected interests, users and regulators of the waterfront. This undertaking demands extensive participation resulting in broad based support of the Program.

CONSISTENCY OF STATE AGENCIES' ACTIONS

The basic thrust of New York State's Coastal Management Program is to have State agencies carry out their respective programs consistent with the policies contained in Section 6 of this document. All of the Program's policies are derived from existing laws and regulations administered by State agencies. Table 1 identifies the various laws that provide the basis for and are essential to the enforcement and implementation of the coastal policies. Many of the Program's policies are carried out by programs administered by the Department of Environmental Conservation. For example, the Department operates regulatory programs which provide protection to tidal and freshwater wetlands (Policy 44), restrict development and other activities in flood and erosion hazard areas (Policies 11-17), and protect air and water resources (Policies 30-35 and 40-43). Other agencies, such as the Office of Parks, Recreation and Historic Preservation, Public Service Commission and the State Board on Electric Generation Siting and the Environment administer programs which provide coastal recreational facilities, regulate the siting of energy transmission facilities and regulate the location of electric power plans, respectively.

Other Program policies are based upon the provisions of Article 42 of the Executive Law. These policies carry out the intention of the State Legislature that there be "a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing the loss of living marine resources and wildlife, diminution of open space areas or public access to the waterfront, shoreline erosion, impairment of scenic beauty, or permanent adverse changes to ecological systems" (Executive Law, Article 42, Section 912(1)). Executive Law, Article 42, requires that actions directly undertaken by State agencies within the State's Coastal Area be undertaken in a manner consistent with this second group of policies. In addition, the procedures of the State Environmental Quality Review Act (Environmental Conservation Law, Article 8) will insure that all State agency actions, of whatever type, will be consistent with these policies.

The Department of State, in cooperation with the Department of Environmental Conservation, has prepared draft regulations to ensure that State agencies carry out their responsibilities under section 915(8) and 919(1) of the Waterfront Revitalization of Coastal Areas and Inland Waterways law. These regulations take two forms: (1) amendments to Part 617 of the State Environmental Quality Review regulations; and (2) new rules to be promulgated by the Department of State.

State Environmental Quality Review Process

Generally, SEQRA is a comprehensive review process that is applicable to all actions of State and local agencies which may have significant effects upon the environment. Agencies are required to determine whether or not a proposed action is subject to the review process. Exempt, emergency and ministerial actions (Type II actions) are exempted from this process, but other proposed activities must be evaluated for their probable impact on the environment. If an agency finds that an action will have significant adverse environmental effects, a “positive declaration” must be made and an environmental impact statement (EIS) must then be prepared. Before making any decision on an action that requires the preparation of an EIS, an agency must prepare written findings which indicate the following: (1) “consistent with social, economic and other essential considerations from among the reasonable alternatives thereto the action to be carried out or approved is one which minimizes or avoids adverse environment effects to the maximum extent practicable; including the effects disclosed in the relevant environmental impact statement,” and (2) “consistent with social, economic and other essential considerations, to the maximum extent practicable, adverse environmental effects revealed in the environmental impact process will be minimized or avoided by incorporating as conditions to the decision those mitigative measures which were identified as practicable.”

New York State’s Coastal Management Program relies upon SEQRA as a means for implementing the consistency requirement under Section 919(1) of the Waterfront Revitalization of Coastal Areas and Inland Waterways law. This review process already contains points of consideration which would help a State agency determine the consistency of a proposed action with coastal policies. In amending the SEQRA regulations to accommodate the waterfront legislation’s directives, two conditions were set: (1) the existing review procedures would not be substantially altered or made complicated; and, (2) the agencies be alerted “up front” of any new procedural and substantive requirements.

The principal amendments to Part 617 of the SEQRA regulations address the following:

For those actions having a significant effect upon the environment and necessitating the preparation of an environmental impact statement, State agencies must ensure that such actions are consistent with the applicable coastal policies contained in the Department of State regulations.

Department of State Regulations

As the State’s Coastal Management Agency, the Department of State must be knowledgeable of the activities occurring in or affecting the Coastal Area. The amendments of SEQRA, as described above, will in part enable the Department to track major activities, for it will receive copies of the EIS documents and have the opportunity to comment on such proposed actions. Draft SEQRA amendments are located in Appendix A.

To avoid burdening the SEQRA regulations with additional procedures, requirements and criteria, the Department of State will promulgate regulations which are applicable to “Type 1” and “Unlisted” actions occurring in the Coastal Area. These proposed regulations dovetail with the SEQRA process. Essentially, the Department’s regulations include the following requirements and/or items:

1. The completion of a Coastal Assessment Form (CAF) is required for all state agency actions in the Coastal Area. This CAF is to be used to supplement other information in order to assist that agency in determining the significance of the action, pursuant to SEQRA. If the action will not have a

significant effect, the CAF will assist state agencies in arriving at their certification decisions, as discussed below.

2. Certificates of consistency must be filed with the Secretary of State for actions that do not have a significant effect upon the environment (as determined under the SEQRA process) and which occur in or affect the Coastal Area or an area covered by an approved local waterfront revitalization program.
3. Coastal policies are described and made a part of these regulations.

All proposed regulations needed to implement the Coastal Management Program will be final prior to approval of the Program.

Judicial Review of Agencies' Decisions

State agencies will be responsible for determining the consistency of their actions with coastal policies. The Department of State will work with the agencies and assist them in fulfilling this requirement under Article 42 of the Executive Law. The Department is not authorized to override the decisions of its sister agencies on matters relating to this Law. A third party may seek judicial review of an agency's determination of consistency pursuant to Article 78 of the Civil Practice Law.

Article 78 proceedings exist primarily to afford relief to parties personally aggrieved by governmental actions. One of the questions that may be raised in such proceedings is whether a determination was arbitrary and capricious or an abuse of discretion. This is a legislative enactment of what has long been the case law of New York. The courts have consistently held that administrative action which is arbitrary, capricious, unreasonable, or an abuse of discretion is subject to judicial review and annulment. In reviewing the action of a public body, the court determines not only whether the action is within the body's statutory power but whether, within the frame of power, the action is arbitrary. Even in the presence of a delegated power of discretion and legislative standards, a determination of a body is reviewed for arbitrariness or unreasonableness within the standards set down.

The test usually applied in deciding the arbitrariness of a determination is whether it has a rational or adequate basis, or, stated in another way, whether the record discloses circumstances which leave no possible scope for the exercise of discretion. Under both the substantial evidence rule and the arbitrary and capricious standard, rationality is what is reviewed by the court.

With respect to who would be "personally aggrieved" so as to have standing to seek relief under Article 78, that hurdle is not a high one in New York State. While a respondent in an Article 78 proceeding may occasionally contest the aggrieved petitioner's standing to sue, the Court of Appeals (the highest court in New York State) has indicated that the right to challenge administrative action should be enlarged rather than diminished. *Dairyalea Cooperative, Inc. v. Walhley*, 38 NY2d 6, 377 NYS2d 451, 339 NE2d 865 (1975). The Court stated that only where there is a clear legislative intent negating review...or lack of injury in fact standing be denied. (*Dairyalea, supra.*, 38 NY at 11, 377 NYS2d at 455, 339 NE2d at 868) No such intent is expressed or manifested in Executive Law Article 42, nor in any other of the State statutory authorities relied upon for implementation of this program.

When taken together, the Department's proposed regulations, the amendments to the SEQRA process and the judicial review of actions will ensure that State agencies will carry out their actions consistent with the policies of the Coastal Management Program. Table 1 lists the essential authorities which State agencies will utilize to implement the Program.

TABLE 1: Legal Authorities Essential to the Implementation of NYS Coastal Management Program

LEGAL AUTHORITIES ESSENTIAL TO THE IMPLEMENTATION OF NYS COASTAL MANAGEMENT PROGRAM		
1.	Agriculture and Markets Law	Article 25 AA – Agricultural Districts
2.	Energy Law	Article 3 – State Energy Policy Article 5 – State Energy Office; Organization and Powers, Function and Duties Article 6 – Energy Planning
3. LOCAL GOVERNMENT INVOLVEMENT

Many coastal communities have adopted regulatory programs which reflect State-established standards and criteria on matters relating to the protection of freshwater wetlands and flood and erosion control. Federal approval of the State’s Program is not, however, dependent upon the preparation and adoption of similar programs by local governments.

The State of New York strongly supports a coastal management effort that encourages local governments to prepare and implement waterfront revitalization programs. Throughout the Coastal Area of the State, many communities have undertaken a variety of activities directed at protecting valuable resources and bringing new vitality to decayed and unused waterfronts. Other waterfront municipalities wish to do so, but lack the financial and/or technical support necessary to accomplish this objective. The State’s Coastal

Management Program will, therefore, focus its attention on communities which want to initiate and/or continue activities that result in the wise use and protection of natural and human-made coastal resources.

The Waterfront Revitalization of Coastal Areas and Inland Waterways law provides the means and incentive for municipalities in the Coastal Area to prepare programs for their waterfront areas and then work with the Department of State and other State agencies implement such programs. By participating, local governments will be eligible to receive financial and technical assistance for the preparation of their waterfront revitalization programs. Upon approval of these programs by the Secretary of State, the communities may also receive assistance for pre-construction activities (e.g., feasibility studies, engineering and architectural designs) essential to projects that are recommended in the approved programs. Further, Section 916(1) of the law requires State agencies to carry out their various regulatory capital construction funding assistance and acquisition activities in ways which are consistent to the maximum extent practicable with the approved local waterfront revitalization programs.

For the purposes of the State's Coastal Management Program, approved local waterfront revitalization programs will provide more specificity to the coastal policies and their geographic application. Since these local programs contain a more detailed approach for managing activities in the Coastal Area, the waterfronts affected by such programs will be treated as special management areas. One of the ways to increase the specificity of the State's Coastal Management Program is the designation and adoption of a program for a special management area.⁹ Section 8 of this report provides more information on special management areas.

Local Program Approval Process

Draft rules and regulations have been prepared which establish review and approval procedures for local waterfront revitalization programs. These proposed rules and regulations are contained in the Appendix of this report.

As required by the authorizing legislation, a local waterfront revitalization program must: clearly identify the geographic area to which it applies; state the goals and specific objectives of the program; demonstrate its consistency with the Act's purposes and coastal policies; inventory the waterfront's natural and historic resources; identify current and future land and water uses in the area; describe the municipality's activities essential to program implementation; demonstrate the community's authority and capability to carry out its program; and, identify specific actions by State agencies which would aid local implementation efforts. This information will assist State agencies in determining the effect, if any, that the local program will have upon their activities. Also, the required information is necessary to increase the specificity of the State's Coastal Management Program.

In reviewing a local waterfront revitalization program, the Secretary of State will consider:

1. Its consistency with the Act's policies.
2. Its fulfillment of the Act's criteria on water dependent and water enhanced uses; public access to coastal waters and water-related activities; promotion and protection of scenic, historic and natural resources; utilization of existing infrastructure; protection of sensitive ecological areas; promotion of port and harbor activities; and incorporation of aesthetic consideration in development activities.
3. Its compliance with existing State policies and State agencies' programs.
4. Its effect upon the facilities, policies and programs of the county and adjacent local governments.
5. Comments provided by the general public, public interest groups, and business organizations.

Notification of the Secretary's approval of a local waterfront revitalization program will be sent to all State agencies and appropriate county and local governments. Amendments to such local programs may be made, but are subject to review and approval by the Secretary. Periodically, the Secretary of State will review the administrative and implementation actions of local governments affecting the Coastal Area for which there is an approved waterfront revitalization program in order to determine if these actions are being carried out in accordance with the goals and objectives of the approved local waterfront revitalization program.

PROGRAM FUNDING

Pursuant to Congressional appropriations, New York State may receive \$3 million in federal funds in FY 82 for the administration and implementation of its approved Coastal Management Program. The State will provide \$0.75 - \$1 million as its match to the federal monies. State funds which are provided for the implementation of the Waterfront Revitalization of Coastal Areas and Inland Waterways law and the Coastal Erosion Hazard Areas law may be counted as part of the State's required match as appropriate.

State Agencies' Activities

The Coastal Management Program is a statewide program that relies upon State agencies for its implementation. Previous parts of this Section indicated what is expected of the various State agencies. Generally, funds will be provided to the Department of State for its administration of the Program, including its administrative functions required under the Waterfront Revitalization of Coastal Areas and Inland Waterways law. The Department's technical assistance to State agencies and to local governments will also be funded by these Program monies.

Where necessary, State agencies will be eligible for funding to cover the costs associated with the consistency determination process. It is anticipated that only the Departments of Environmental Conservation and Transportation and the Office of Parks, Recreation and Historic Preservation, and the Office of General Services may require funds for this purpose. The implementation of State programs critical to the continued approval of the Coastal Management Program will receive necessary financial support. Some State agencies may assist the Department of State in providing technical assistance to local governments and in turn be compensated for their efforts. Finally, some agencies will be encouraged to undertake special studies that will advance Program objectives, including those contained in approved local waterfront revitalization programs. Such studies may focus on one or more coastal concerns and apply to the entire or some portion of the State's Coastal Area.

Local Government Activities

During the preparation of the State's Coastal Management Program, the Department of State encouraged coastal communities to become involved in the Program. Many local governments did participate.

Funding was provided to some for the preparation of waterfront management programs; others received financial assistance to conduct special studies related to a local coastal issue or project. The desire of local governments to bring new or additional vitality to their waterfronts far exceeded the funds that the Department had for this purpose.

Local governments' interest and participation in the State's Coastal Management Program are expected to be substantial. In anticipation of this level of involvement, approximately 50% of the available funds will be allocated for local government efforts. The preparation of waterfront revitalization programs and preconstruction activities for projects recommended in approved waterfront programs will be eligible

activities. Special studies which address one or more coastal issues affecting two or more adjacent coastal communities will be eligible for funding under the State's Program. A maximum of one, 12 month grant, not exceeding 50% of the cost for preparing a local waterfront revitalization program may be available.

Local governments will be expected to draw upon their own agencies for the technical expertise that is needed to perform any of the eligible activities. In instances where a local government may not have the capability to undertake such tasks, the Department of State, other State, county and regional agencies should be consulted and, if appropriate, requested to provide the necessary technical expertise. Program funds would be made available to the local government for this purpose.

Funding Priorities

Pursuant to Congressional appropriations, the State of New York may receive \$3 million. Given this uncertainty, it is not possible at this time to determine how much money will be allocated to the various Coastal Management Program related activities. However, some general priorities are established to guide the Department of State in its allocation of these funds.

Coastal Management Program funds will be used by State agencies for implementation of State programs critical to the continued approval of the Coastal Management Program, including consistency activities and special studies, if necessary.

Program funds for local government activities will be used for:

1. Preparation and implementation of local waterfront revitalization programs and local ordinances for erosion hazard areas; and,
2. Pre-construction projects and other activities recommended in approved waterfront revitalization programs.

SECTION 5 – COASTAL ISSUES

DEVELOPMENT

Introduction

Coastal development is an all pervading concern of New York's Coastal Management Program, and its consideration is recognized and reflected throughout the other policy discussions -- most notably in Agriculture, Energy, Fish and Wildlife, and Recreation. There are several other aspects of coastal development which are discussed below and form the basis for the policies that will guide the State in its various development decisions along the shore.

Deteriorated and Underutilized Waterfront Space

The exodus of people and commerce from the inner city is most clearly manifested in the underutilized, sometimes abandoned and often deteriorated sites found along urban waterfronts. Outdated and deteriorating private and public facilities, the need for more space, increased reliance on trucking, deteriorated surrounding neighborhoods, spiraling property taxes, and financial incentives provided by suburban counties and other states, are some of the reasons for the reduction in development activity along New York State's urban waterfronts.

The Program seeks to reverse this trend so that revitalized urban waterfronts can regain their position as focal points for industry, commerce, culture, recreation and housing.

Competition for Space

Although much of the State's coastline is underutilized, some areas are subject to intense use pressures. The reasons a particular site becomes desirable for development vary, but are generally related to such factors as topography, local climatic and soil conditions, access to transportation, aesthetic value, and surrounding land uses. Unfortunately, where there is competition for a particular site, the market mechanism and existing regulations do not always ensure that the public interest will be served. For example, many uses which are dependent on a waterfront location are preempted by development that merely seeks the convenience of a visually-enhanced setting, or by happenstance. The problem of competition for space can be particularly acute in urban areas.

Because it is the obligation of the Coastal Management Program to consider the long-range interest of the public, the task of the Program thus becomes one of determining which uses should receive priority treatment in the coastal areas, and what form that treatment should take.

Incompatible Adjacent Uses

Because certain sites are desirable locations for a number of uses, a situation often develops where incompatible activities are forced to locate next to one another. An example of this would be in port areas where heavy industrial uses may lower air, water and visual quality, and raise surrounding noise levels, with a consequent reduction in the enjoyment of those people who are participating in nearby recreation activities. Recreational uses within harbor areas, on the other hand, can inhibit port development by

restricting industrial expansion, forcing port interests to alter dredging operations, interfering with shipping movements, or by creating safety hazards.

When incompatible uses are, or are proposed to be, located adjacent to one another, the Coastal Management Program, in conjunction with other State and local programs, is faced with the task of mitigating the negative aspects. When new development is to take place, steps should be taken to ensure it will locate where adjacent uses are compatible and, preferably, supportive.

Transportation Issues

State transportation policies have a substantial role in shaping the course of development. Following are those transportation issues which have particularly important implications for the Coastal Management Program:

A. Consequences of Major Transportation Improvements

Most of the State's planned transportation system is already in place. However, significant new developments or modifications may occur in the future. Such improvements would probably bolster the economy of an area, but negative consequences are also possible insofar as another area might be put at a competitive disadvantage, orderly or planned growth patterns might be disrupted, or serious environmental problems might be caused.

B. Access to the Waterfront

While the State's coastlines have served as natural corridors for highways and railroads, the coastlines have frequently been made inaccessible by the existence of these same transportation facilities. For the most part, the damage is done and is, for the foreseeable future, irreversible. However, where new facilities are being planned and where existing facilities do not preempt use of the shoreline, opportunities to increase public access can be accommodated if cost and safety considerations are not prohibitive. This issue is further discussed in the Public Access section.

C. Competition between Transportation Modes

Relationships among the various modes of transport (particularly the relationship between rail and ship) will vary according to circumstance. In many cases, rail and ship lines are mutually supportive (as in Oswego, where the local Port Authority has opposed the abandonment of the Erie-Lackawanna rail line, and as in New York Harbor, where rail service is being reestablished on the Brooklyn waterfront with the objective of enhancing general port activity.) In other situations, various modes of transportation may directly compete with each other, and State supportive action in favor of one may have negative effects on another. The State must encourage a relationship between the various modes of transportation that is based on healthy competition, if not mutual support.

D. Water Transportation Issues

Continued dredging of harbor areas and rivers is a necessary component in any long range improvement of the State's water transportation facilities. The depth to which the channels should be dredged, the precise location, and the manner in which the dredge spoils should be disposed of, are problems that must be addressed. Dredge spoils are further discussed in the Water Resources issue section.

The shipping industry needs accurate knowledge of tides, wind and water depths so that ship movements can be effectively planned. To meet this need, New York State will soon install, and then begin testing, a tidal gauge system for New York Harbor and the Hudson River.

Non-port related activities often have been proposed, or located, adjacent to major port areas, in a manner that could inhibit normal port operations. Mechanisms need to be developed that will recognize the needs of port development when potentially conflicting activities are proposed within or adjacent to port areas.

Navigation on the Hudson River, in New York Harbor and in commercial boat harbors is severely constrained by floating debris. The debris comes from sources such as decaying piers and bulkheads, abandoned barges and ships, and vegetation such as large tree trunks. (It is estimated that approximately 600,000 cubic feet of debris enter the Hudson River and New York Harbor annually.) The debris poses a serious threat to commercial shipping and recreational craft.

Concentration of Development

The argument for concentrating development is based on the need to: increase energy efficiency, reduce the cost of public services, make more efficient use of existing infrastructure, increase the likelihood of downtown revitalization, and improve the protection of valuable natural resources.

The Program considers the concentration of development to be crucial in coastal areas because development pressures there are more severe, while the unique natural functions performed by coastal areas are critical to attaining both a sound economy and a sound environment.

The issue faced by the Program is how to accomplish concentrated development, not with a negative approach that merely restricts development, but by adopting a positive approach that seeks to stimulate and guide development where it would be desirable.

Offshore Development

Offshore resource development and other uses on the Outer Continental Shelf (OCS) may affect coastal resources and uses important to New York. While New York State has jurisdiction in its coastal waters, matters pertaining to the OCS are under the jurisdiction of the federal government. Consequently, the Department of State actively participates in OCS planning and decision-making processes under a number of federal statutes, and reviews and voices the State's concerns about federal OCS energy development activities, licenses, permits, lease sales and plans.

State coastal uses and resources may be affected by the development of offshore energy resources and other existing offshore uses including, but not limited to: fisheries management; sand and gravel mining; military readiness training and related exercises; changes or upgrades to established navigation patterns and infrastructure, including the re-routing of existing navigation lanes and the location, placement or removal of navigation devices which are not part of the routine operations under the Aids to Navigation (ATON) program; permits for deepwater ports; the identification of interim or permanent open-water dredged material disposal sites; the intentional submergence of vessels and other structures, including for the purpose of creating artificial reefs; the creation of human-made islands, tidal barriers, or the installation of other fixed structures; scientific research activities; and exploration and identification of potential resources for extraction, such as biopharmaceutical products.

In its review of proposed activities, licenses, permits, lease sales and plans in the Atlantic OCS and New

York State coastal waters, the Department of State works with state and federal agencies to considers a number of factors, including but not limited to: the potential effects upon maritime traffic, including navigational safety leading into and from New York's ports; the potential for increased port development and economic activity; aspects of national security; the effects on important finfish, shellfish, seabirds, marine mammals, and other wildlife populations and their spawning, wintering, and foraging habitats; impacts on biological communities; the potential impacts of the status quo on ecosystems; economic and other effects upon commercial and recreational fishing activities; impacts on public recreational resources and opportunities along the marine coast and offshore; the potential for geo-hazards; water quality; and overall effects on the resilience of New York's coastal uses and resources.

New York State continues to enhance its understanding and awareness of the importance and connectedness of offshore areas to the State's coastal zone. In addition to review of proposed activities, the New York State Department of State and other state agencies and authorities are using this new information to conduct proactive planning work to determine potentially suitable areas for existing and new offshore uses, particularly renewable energy development. Similar planning and enhanced decision-making frameworks are being developed at the regional and national levels, including formal marine spatial planning efforts. Marine spatial planning is a collaborative process using science-based tools to better inform and guide decision-making and coordinate activities among all coastal, ocean and Great Lakes interests, by engaging affected communities and stakeholders, sharing information, addressing ocean management challenges, and advancing goals for economic, environmental, security, and social and cultural interests. Coordination across the local, interstate, and federal levels will remain a key focus of New York State's Coastal Management Program as these collective efforts mature and transition to implementation.

Smart Growth¹⁰

Smart Growth is sensible, planned, efficient development that integrates job creation and economic development with community quality-of-life by preserving and enhancing the built and natural environments and creating ecologically sustainable, economically vibrant and equitable, and higher quality of life communities and regions. Smart Growth encourages community planning and development in priority economic growth areas where existing infrastructure is available, particularly municipal centers, downtowns ("Main Streets"), urban cores, hamlets, historic districts and older first-tier suburbs and protects important natural and historic resources, including water quality. At the same time, Smart Growth seeks to discourage development and growth on open space and farmland, and underdeveloped areas with inadequate infrastructure.

The development pattern in post-war America continued to sprawl outward in successive waves. As first- and second-ring suburban populations grew and traffic congestion increased, development just moved further out into rural farmland, with larger lots and bigger homes. A key strategy was to build more roads and highways, and widen existing ones. But this usually invited more traffic and more sprawling development, which in turn generated greater demand for more and wider roads, and the cycle just repeated itself. In this way, transportation infrastructure investments – as well as other forms of infrastructure and government policies – subsidized the proliferation of spread-out, auto-dependent, low-density, single-use development. The rate at which land was developed soon far outpaced population growth. Between 1982 and 1997, for example, developed land in the Northeast increased 39 percent, while the population increased only 7 percent.¹¹ Upstate New York also experienced "sprawl without growth" – that is, between 1982 and 1997, developed land increased by 30 percent, while the population only increased 2.6 percent.¹²

Today New York’s coastal regions face serious land use and development challenges. New York City, projected to add more than half a million people within a generation, will need to accommodate that population growth with no ability to expand its existing municipal boundaries. New York City will need to consider how to repurpose existing brownfields, expand transit capacity, increase affordability housing, increase energy production capacity and reliable delivery with an updated electric grid. New York’s rapidly growing suburbs in Suffolk, Orange, Putnam, and Dutchess Counties are also expected to grow rapidly in the coming decades. Maintaining a high quality of life, historic village character, small family farming and high environmental and water quality while accommodating population growth is a mounting challenge.

At the same time, upstate rural areas are experiencing population declines with the loss of jobs and dwindling economic opportunities. Aging infrastructure is common in upstate urban communities and older suburbs, while new development into more distant open space areas is demanding extension of new infrastructure. Adding new infrastructure including roads and bridges; power, water and sewer lines; shopping malls and schools, further into the countryside, while continuing to maintain older urban infrastructure is often cost-prohibitive and inefficient.

Smart Growth provides a more effective strategy to address these trends and challenges. Specific Smart Growth tools and principles include: compact conservation-oriented development; mixed land uses; strategic farmland and open space preservation; accessible and well-designed parks and public spaces; historic preservation; brownfield clean-up and re-development; vacant property re-use; revitalization of existing developed areas; regional and inter-municipal land use and transportation planning; infill development; “green” buildings and infrastructure; varied mobility choices, including walking, biking and public transit; age-, income- and ethnically-integrated communities; targeted investments in affordable housing; transit-oriented development; and collaborative, public, inclusive and stakeholder-driven planning processes.

The State Smart Growth Public Infrastructure Policy Act augments the state’s environmental policy by adopting Smart Growth policies to maximize the social, economic and environmental benefits from public infrastructure development and minimizing unnecessary costs of sprawl development, including environmental degradation, disinvestment in urban and suburban communities and loss of open space induced by sprawl. Sprawl is facilitated through the funding or development of new or expanded transportation, sewer and waste water treatment, water, education, housing and other publicly supported infrastructure inconsistent with Smart Growth criteria.

The State Smart Growth Public Infrastructure Policy Act has designated the Department of State as an “infrastructure agency,” and no state infrastructure agency shall approve, undertake, support or finance a public infrastructure project, including providing grants, awards, loans or assistance programs, unless it is consistent with the following smart growth criteria:

- To advance projects for the use, maintenance or improvement of existing infrastructure;
- To advance projects located in municipal centers;
- To advance projects in developed areas or areas designated for concentrated infill development in a municipally approved comprehensive land use plan, local waterfront revitalization plan and/or brownfield opportunity area plan;

- To protect, preserve and enhance the state’s resources, including agricultural land, forests, surface and groundwater, air quality, recreation and open space, scenic areas, and significant historic and archeological resources;
- To foster mixed land uses and compact development, downtown revitalization, brownfield redevelopment, the enhancement of beauty in public spaces, the diversity and affordability of housing in proximity to places of employment, recreation and commercial development and the integration of all income and age groups;
- To provide mobility through transportation choices including improved public transportation and reduced automobile dependency;
- To coordinate between state and local government and intermunicipal and regional planning;
- To participate in community based planning and collaboration;
- To ensure predictability in building and land use codes; and
- To promote sustainability by strengthening existing and creating new communities which reduce greenhouse gas emissions and do not compromise the needs of future generations, by among other means encouraging broad based public involvement in developing and implementing a community plan and ensuring the governance structure is adequate to sustain its implementation.
- To mitigate future physical climate risk due to sea level rise, and/or storm surges and/or flooding, based on available data predicting the likelihood of future extreme weather events, including hazard risk analysis data if applicable.

Better infrastructure and non-infrastructure planning and decisions are made in consideration of principles of Smart Growth, along with resilience, sustainability, energy efficiency, and ecosystem-based management principles and approaches.

Sustainability¹³

In 1987, the UN Brundtland Commission defined sustainable development as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” A sustainable society manages resources in a way that fulfills the social, economic, and environmental needs of the present without compromising future generations’ needs and opportunities. New York State is committed to the sustainability of its coastal areas, and sustainable economic development within its coastal communities. Coastal development is sustainable when economic activity and other community actions occur without eroding social assets and wellbeing within communities; without depleting nonrenewable resources or sources of energy; without releasing pollution beyond the capacity of the ecosystem to naturally process it; without emitting greenhouse gases (GHGs) beyond the capacity of the atmosphere to naturally process them; or without otherwise damaging ecosystem functions and services that humans need.

Sustainable coastal communities adopt practices to:

- Conserve resources to protect the natural environment and ensure essential ecosystem services
- Control sprawl to reduce housing, infrastructure and transportation costs and impacts
- Reuse and restore developed land to improve economic potential
- Develop neighborhood businesses to create quality jobs and keep dollars local
- Adopt clean technologies to develop a vibrant 21st century economy
- Expand renewable energy sources to ensure the long term availability of clean energy
- Reduce greenhouse gases to improve and protect the environment, human health, and the climate

- Encouraging broad based, equitable public involvement in developing and implementing sustainability strategies
- Ensure the governance structure is adequate to sustain implementation of sustainability strategies

Environmental Justice¹⁴

Environmental justice is defined as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Historically in the United States, race and class have played significant roles in environmental decision-making, and communities of color and low-income communities have been disproportionately affected by siting decisions and the permitting of facilities. This has resulted in the disproportionate allocation of burdens, risks, market externalities and benefits to different communities. Environmental justice efforts focus on improving the environment in communities, specifically low-income communities and communities of color, and addressing disproportionate adverse environmental and health impacts, including cumulative impacts, that may exist in those communities. Environmental justice will be achieved when every community enjoys the same degree of protection from environmental and health hazards, equal benefits of environmental services and natural resources, and equal access to the decision-making process to have a healthy environment in which to live, learn, and work.

New York's Coastal Management Program includes integration of environmental justice concerns and makes achieving environmental justice one of its goals. This effort includes both fair treatment and meaningful participation of all affected communities. Fair treatment means that no group of people should bear a disproportionate share of environmental consequences (burdens, risks, market externalities and also benefits) resulting from industrial, governmental and commercial operations or policies. Meaningful involvement means that decision makers seek out and facilitate the involvement of those potentially affected and provide an opportunity for communities to participate in environmental decisions, influence a regulatory agency's decisions, and have their concerns considered in the decision making process.

The New York State Department of Environmental Conservation developed and implemented a Commissioner Policy 29 on Environmental Justice and Permitting (CP-29) which guides the incorporation of environmental justice concerns into the State Environmental Quality Review Act (SEQRA) process and other DEC environmental permit review processes. DEC also identified and mapped potential environmental justice areas based on the 2000 US Census demographic data. Public Service Law Title 10 concerning energy facility siting, and corresponding NYS DEC regulations in 6 NYCRR Part 487, require an environmental justice analysis that evaluates significant and adverse disproportionate environmental impacts of a proposed energy facility resulting from its construction and operation. This includes a cumulative impact analysis of air quality and a comprehensive demographic, economic and physical description of the community, including reasonably available data on population, racial and ethnic characteristics, income levels, open space, and public health data, including available department of public health data on incidents of asthma and cancer. Public Service Law Title 10 also requires enhanced public participation and review of environmental impacts of proposed major electric generating facilities in environmental justice communities and reduce disproportionate environmental impacts in overburdened communities. New York's State Smart Growth Public Infrastructure Policy Act calls for "social equity" by including consideration of all income and age groups.

New York's 2015 State Energy Plan recognizes that environmental justice communities have been disproportionately impacted by air pollution from fossil fuel power generation facilities and transportation

infrastructure that historically have been sited in or near these communities. In addition, low- to moderate-income (LMI) consumers pay a disproportionate share of their income toward the cost of energy. These consumers also are less likely to be reached in the near term by clean energy market actors and project developers because of perceived credit risks.

New York State's 2011 climate change report and action plan, ClimAID, and its 2014 update, recognize that certain groups, types of communities, and regions within the state are better able to respond to climate risk and vulnerabilities than others. Communities, groups, and locations currently at risk because of limited response capacity and resilience to climate hazards (e.g., those who are economically marginal) are, in most cases, those that will be most vulnerable to future climate change impacts.

Coastal environmental decision making includes enhanced public participation efforts, considers the Department of Environmental Conservation's list of potential environmental justice areas within the coastal zone, and identifies potential environmental impacts that may disproportionately affect low income communities, communities of color, and tribal communities. Environmental justice efforts respond to potential environmental justice issues by adapting planning, activities, policies, and decisions where appropriate.

Permitting Procedures

The public perceives that increased costs of "doing business" results from burgeoning government regulations. Builders state their costs have increased, in part, because of unnecessary regulations and excessive design standards.

Some manufacturers view regulations in New York State as a reason not to expand and in some cases a reason to relocate out of State. The Coastal Management Program agrees that the accumulation of single purpose environmental and land use controls has frequently resulted in overlaps, redundancies and inequities in the administration of regulations. The way in which regulations of local, State and federal government agencies are integrated can be improved.

Consequently, the Waterfront Revitalization of Coastal Areas and Inland Waterways bill was enacted so as to require the Secretary of State to work with other agencies in an effort to determine ways of expediting development and seeking additional means of effectuating waterfront revitalization. Simplifying and consolidating permit procedures is one means to achieve this desirable goal.

CLIMATE CHANGE¹⁵

Introduction

A major emerging coastal issue of concern for New York State is climate change and the corresponding impacts of ocean warming and the warming of Great Lakes waters; sea level rise and flooding; ocean acidification; marine species migration; increased severity of coastal storm events; and changing precipitation patterns. Climate change is already affecting New York State, posing a significant threat to our environment, economy, human health and wellbeing, and quality of life, and its impacts are projected to grow. The current and anticipated rate of climate change is unprecedented in human history. Over the last century, global average temperatures have been increasing and sea levels have been rising as a result of alterations in the Earth's climate. Climate change results primarily from the combustion of fossil fuels and land use change and other human activities that produce excessive greenhouse gas emissions, including

ozone (O₃), nitrous oxide (N₂O), and especially “carbon pollution” from carbon dioxide (CO₂) and methane (CH₄).

According to New York State’s 2011 ClimAID report, “the atmospheric concentrations of the major GHG carbon dioxide (CO₂) are now more than one-third higher than in pre-industrial times. The concentrations of other important GHGs, including methane (CH₄), have increased as well. Because some of the added GHGs will remain in the atmosphere for centuries, and some parts of the climate system respond in a gradual manner, awareness is growing that some climate changes are inevitable.” Climate change—and associated uncertainties in future climate projections, as well as complex linkages among climate change, physical systems, biological systems, and socioeconomic factors—poses special challenges for New York State coastal communities because of its broad impacts on coastal zones, ecosystems, water resources, agriculture, energy, transportation, telecommunications, and public health. These climate impacts may exacerbate existing stresses on the people and activities of New York State.

Coastal System Impacts

Warming Waters and Sea Level Rise

New York’s average air and water temperatures are projected to increase significantly over the coming decades. Sea level rise rates are impacted by the effects of both global climate change and residual crustal adjustments to the loss of the North American ice sheets during the last ice age. Most of this climate-related sea level rise to date has been caused by the physical expansion of ocean waters as they warm, since warmer waters take up more space than colder waters. In recent years, the relative contribution of melt water from land-based ice has exceeded that of thermal expansion – a trend that is projected to continue.

Since 1900, sea levels on New York State’s coastlines have been rising from 0.86 to 1.5 inches per decade, averaging 1.2 inches per decade. By the year 2100, sea levels along New York’s coast are projected to rise between 11 and 75 inches, increasing storm-related coastal flooding. Sea level rise will greatly amplify risks to coastal populations and will lead to permanent inundation of low-lying areas, more frequent flooding by storm surges, and increased beach erosion. Ocean saltwater will reach farther up into coastal waterways and estuaries, threatening urban drinking water supply intakes and inundating groundwater. The uncertainty surrounding predicted rises in sea levels is a major challenge to adequate preparation and adaptation. New York State’s Community Risk and Resiliency Act requires the adoption of official sea level rise projections with updates every five years.

Changed Precipitation Patterns

In general, climate change is transforming New York’s water cycle, impacting the quantity, frequency, intensity, and geographic location of where rain, snow and other forms of precipitation fall throughout the state. New York’s summertime rain is expected to fall more often as heavy downpours in shorter periods of time, leading to more flooding. At the same time, the length of time between these intense rainstorms is likely to increase, creating extended periods when some regions will receive much less rainfall, leading to droughts. Higher average temperatures will increase soil evaporation, enhancing drought effects on natural and agricultural systems. Heat waves are also expected to become more frequent and more intense. Greater incidence of heavy rainfall events affect food production, drinking water, the shifting of stream channels, marine and freshwater fisheries, and natural watershed dynamics. As regular winter precipitation changes from snow to rain and ice, increased frequency of winter ice storms will challenge infrastructure reliability and delivery of emergency services. Increases in winter stormwater runoff rather than accumulating snowpacks will have implications for soil erosion and water quality and quantity. Uncertainty of climate

impacts on Great Lakes precipitation and evaporation patterns, and the corresponding uncertainty of future lake water levels, also pose a major challenge to planning for preparation and adaptation.

Increased Frequency and Intensity of Coastal Storms

Large-scale coastal storms, including nor'easters and hurricanes, can produce intense precipitation, destructive winds, unusually large storm surges, and devastating flooding, especially in low-lying coastal areas. Much of New York City and coastal Long Island, especially the south shore along the Atlantic Ocean, is less than 10 feet above sea level and is vulnerable to coastal flooding during major storm events. Recent major coastal storms, including Hurricane Irene (August 2011), Tropical Storm Lee (September 2011) and Superstorm Sandy (October 2012), the largest and second-costliest hurricane in US history after Hurricane Katrina, have increased concerns about the financial, social and environmental costs of climate change impacts.

Flooding

In New York State, heavy rainfall can lead to flooding in every season. In much of New York State, flooding is most frequent in spring, when rapid snowmelt and rains lead to surface water runoff. Ice jams sometimes contribute to serious flooding during spring and winter as well. Coastal areas, low-lying areas, and urban areas with high levels of impermeable surfaces, including roads, sidewalks, parking lots and buildings, are particularly vulnerable to flooding. However, increasingly large and powerful storms are able to carry more water from the ocean and release it over high-elevation inland areas as well. Sea level rise compounds coastal flooding from storms, and flooding will very likely increase in intensity, frequency, and duration with increases in sea level rise. Any increase in the frequency or intensity of storms will also contribute to increased flooding.

Ocean Acidification¹⁶

Since the oceans absorb large amounts of carbon dioxide (CO₂) from the atmosphere, as atmospheric CO₂ increases, so does the concentration of CO₂ in the oceans. This results in the creation of carbonic acid (H₂CO₃) and a decrease in the pH of ocean waters to make the ocean more acidic. There has been a 30 percent increase in acidity of ocean water since pre-industrial times over 200 years ago, and ocean water is projected to become exceptionally more acidic over the next several decades. Ocean acidification is expected to cause large-scale changes in ecosystem structure, as certain species are less capable of adapting to rapid changes in more acidic waters. Many shell producing species, like oysters and tiny pteropods that make up an essential part of the ocean food chain, are not able to properly form carbon-based shells in acidic marine waters, and so are being negatively affected. Ocean acidification is already impacting the shellfish industry in other areas, and will have increasingly serious ramifications for the ocean food web and the commercial and recreational fishing and aquaculture industries as the ocean continues to acidify.

Species Migration and Marsh Migration¹⁷

As climate change contributes to the warming of ocean waters--the highest average temperature levels seen over the last 150 years--marine species are changing their behavior, and saltwater marshes are migrating inland to follow the rising waterline. There have also been shifts in species phenology, the annual timing of major life cycle events, such as migration, reproduction, and flowering. Several northeast fish stocks have migrated northward and/or further offshore away from warmer ocean waters. Saltwater marshes may have difficulty in migrating quickly enough to keep pace with sea level rise. Climate-induced changes in ocean circulation patterns also change where fish are spawning. Changing ocean temperature dynamics favor some species at the expense of other species, resulting in changes on the marine food web. For

example, Atlantic surf clams in the northeast Atlantic have suffered higher mortality rates in warmer waters. As water in coastal and ocean environments becomes warmer, these areas are also becoming more hospitable to certain species of algae, and are resulting in increased harmful algal blooms that are dangerous to marine and human health.

Mitigation and Adaptation

Because effects of current emissions can last for decades, New York State has determined that it is essential to engage in climate change mitigation efforts while there is still time to have a significant impact on reducing climate disruption. Projected future scenarios for “climate disruption” based on “business as usual” policies and current emission trends that do not reduce carbon pollution are socially, economically, and ecologically unacceptable. New York has responded to climate change risks with mitigation strategies and policies that commit the state to reductions in excessive greenhouse gas emissions, and the official goal is an 80 percent reduction in greenhouse gas emissions by 2050. While these mitigation efforts will not prevent all current and future climate change impacts, significant reductions in excessive greenhouse gas emissions are essential for limiting and reducing the more extreme and severe climate change impacts expected in the decades to come. At the same time, New York is also actively pursuing climate change adaptation strategies in an effort to both minimize the impacts and prepare for unavoidable future changes. Adaptation strategies attempt to reduce vulnerabilities and risks by increasing the resilience capacity of local communities.

Coastal Resilience

Coastal resilience is the capacity for a community and its ecosystem to withstand extreme events and other forces or risks; quickly recover the interconnected social, economic and ecological systems’ structure and function in the aftermath of a disaster; and develop ongoing adaptability to rapidly changing environmental conditions and forces. Adaptation strategies are considered most effective when they enhance both short-term resilience capacity and long-term sustainability--the enduring viability and robustness of a community’s social, economic, and ecological systems and built infrastructure. Since these social, economic, and ecological systems are interdependent and integrated, any attempt to enhance one of these systems at the expense of any other system through short-term “tradeoffs” will often inevitably undermine all of these systems in the long term. Working toward resilience and sustainability fosters mutual long-term prosperity and stability for people and the environment in New York’s coastal regions. For New York’s coastal communities to achieve sustainability within the context of climate change conditions, incorporating resilience measures will be essential, including the use of natural infrastructure and natural processes, and avoiding investments that are not highly adapted to a changing climate. New York State is working to increase the resilience of New York communities in anticipation of interconnected forces of unfolding climate change concerns, impacts from ongoing coastal development, and broader socio-economic changes from globalization.

Coastal resilience measures should also be concerned with ensuring viable ecosystem services and functions. Ecosystem services are those services produced by healthy ecosystems that people want and need. Functioning coastal watershed ecosystems, Great Lakes ecosystems and ocean ecosystems provide a variety of these services, along with products and other benefits that are critical for human survival, wellbeing and prosperity. Ecosystem services include: moderating the hydrological cycle that affects surface and groundwater flows, removes water pollutants, processes wastes, and regulates flood events through flood storage; moderating water quality for drinking and irrigation; mitigating natural hazards and

disease and protecting shores from erosion; regulating air quality, sequestering carbon, moderating climate and weather, and regulating climate change effects; and providing water-borne transportation and shipping, pest control, pollination, photosynthesis, nutrient cycling, soil formation, and food security. Ecosystem products include drinking water, food, seafood, and other agricultural and ocean products; medicines, minerals, hydrocarbon fuels, and energy; fish and wildlife, habitats, and biodiversity; and biofuels, fiber, timber, and other biomass and forest products. Cultural services include many nonmaterial benefits like aesthetic values and inspiration experiences; spiritual and religious benefits and cultural heritage values; research, knowledge and educational experiences; recreational fishing, boating, swimming, and other recreation. Coastal ecosystem services are generated from the uplands of coastal watersheds to the coastal shores and out to the open waters of the ocean, estuaries, and Great Lakes. Some services, products, and benefits are easier to quantify and value in dollars, but effective management and regulation should consider all of these in order to protect and harvest the full resilience potential of coastal ecosystems in the face of climate change. New York State recognizes the value of natural protective factors derived from ecosystems, and promotes the use of green infrastructure and living shorelines to enhance coastal community resilience wherever and whenever appropriate. Effective resilience measures are ones that ensure that resilience of one set of preferred ecosystem services, products, and benefits do not undermine other critically needed or valued ecosystem services, products, and benefits.

New York’s climate change adaptation, mitigation, and resilience strategies and policies are intended to be proactive efforts to both solve immediate problems and spur innovation and entrepreneurship to advance smarter technologies, increase energy efficiencies, and foster more healthy and productive ecosystems. The innovations are expected to create new industries, quality jobs, and better products and services that reduce or eliminate harmful and expensive carbon pollution, while also reducing solid waste, contaminated brownfields, health risks, and energy inefficiencies. New York State can turn these challenges into economic opportunities. For example, by becoming a hub of the new clean energy economy, and by making policies and investments, including smart electric transmission and distribution systems, low-carbon buildings, and zero-emission vehicles, and increase options for alternative modes of travel and land use, that together bring low-carbon choices to current and future generations, a more resilient and sustainable economy can emerge, with co-benefits like quality green collar jobs, technological innovation, energy security, and cleaner air and water. The 2015 New York State Energy Plan includes strategies for facilitating and accelerating the use of low-carbon energy sources and carbon mitigation measures. Because of this, implementation of strategies under the State Energy Plan will advance appropriate energy policies that fully account for the climate change impacts from energy production and use in New York State. This will be an important driver for New York’s more resilient clean energy economy.

ECOSYSTEM-BASED MANAGEMENT¹⁸

Introduction

The 2005 Scientific Consensus Statement on Ecosystem-based management provided the following definitions: “Ecosystem-based management is an integrated approach to management that considers the entire ecosystem, including humans. An ecosystem is a dynamic complex of plants, animals (including humans), microbes and physical environmental features that interact with one another.” Under the traditional jurisdictional approaches that also usually focused on single, specific sectors, managing each particular activity, such as fishing, shipping, energy development, recreation and tourism, and coastal development, as independent activities. These traditional approaches were not as effective at sustainably

managing complex issues of coastal and marine ecosystems. For example, traditional management decisions often resulted in fish stock collapses, ocean dead zones, and devastating ocean oil spills. Through a 2006 statute, the New York Ocean and Great Lakes Ecosystem Conservation Act, New York State has officially adopted an ecosystem-based management (EBM) approach to manage and govern its coastal ecosystems.

Elements of Ecosystem-Based Management

The policy of New York State is to conserve, maintain and restore coastal ecosystems so that they are healthy, productive, sustainable and resilient, and able to deliver the ecosystem services and resources people want and need. The ecosystem-based management approach is a science-based approach that arose out of research insights as a more comprehensive form of natural resource management that helps to achieve healthy, productive and resilient ecosystems. EBM broadens the scope for understanding how ecosystems and social systems work interdependently by assuming interconnectedness of ecosystems and social system (the social-ecological system). EBM considers the interconnected ecological, social and economic factors, and recognizes that system interactions are complex and are not always completely predictable. EBM considers cumulative impacts on ecosystem structures and functions, and promotes decision making even when there are scientific uncertainties. Under conditions of scientific uncertainty, precaution is applied when making decisions. Planning and decision making processes include broader stakeholder involvement for diversity of input, and ongoing monitoring of management practices so that adjustments in management actions—called adaptive management—can be made periodically to correct any errors in implementation. EBM also includes interagency cooperation across agency jurisdictions to consider a broader spatial scale for ocean and coastal ecosystems. New York State has joined in regional (i.e., interstate) and state-federal partnerships to coordinate actions on shared management priorities for resources that cross territorial boundaries. New York’s coastal management decisions reflect the management principles of ecosystem-based management.

FISH AND WILDLIFE

Introduction

The abundant fish and wildlife found in New York’s coastal areas, particularly its estuaries, have long been recognized as important food resources and for their recreational and commercial value. As an indicator of their direct value to the State, the economic benefits derived in 1976 from commercial and sport utilization of New York’s marine fisheries were estimated to be \$87.8 million and \$222.5 million respectively. In 1981, resources from sport fishing in freshwaters were estimated to be \$405 million.

The State’s fish and wildlife resources also provide a less direct but equally important social benefit in that they function as indicators of the quality of the human environment. The decline of certain species (often the rarer species) is frequently an early symptom of environmental stress and degradation.

Finally the State’s living coastal resources are important in terms of their own intrinsic ecological value. Diversity of flora and fauna provides stability to an ecosystem. In addition, these living resources contribute to the productivity of coastal environments through their conversion of energy and recycling of materials.

Hence, the basic goal of New York’s fish and wildlife management programs has been to protect, manage, and develop these resources so that they sustain their capacity to continue providing these economic, social, and ecological benefits.

Habitat Protection

Valuable fish and wildlife species cannot be protected and maintained without preserving their habitats. While loss of individual animals can usually be made up by reproduction, loss of habitat will likely result in an irreversible loss to fish and wildlife. A habitat is an area where there exists a unique combination of resources (food, shelter, living space, etc.) and environmental conditions (temperature, climate, salinity, etc.) which animals need for their survival. When human activities destroy a vital resource or alter an environmental condition beyond an organism's range of tolerance, we destroy its habitat.

Certain habitats, such as breeding grounds, nursery areas, and migratory routes, are special areas where fish and wildlife populations tend to congregate. Such areas must be identified and afforded special protection, since their loss would create a greater threat to the survival of a population than would the loss of areas where the organisms were less densely distributed.

In New York, a category of habitats which has been suffering the greatest losses are freshwater and tidal wetlands. Until 1973, draining and filling of wetlands for development purposes was largely unregulated.¹⁹ Wetlands provided convenient, inexpensive sites for disposal of dredge spoils. Such practices resulted in the loss of breeding, nesting and feeding grounds for reptiles, amphibians, mammals, shorebirds and waterfowl, as well as the loss of spawning and nursery areas for fish, shellfish and crustaceans. Many of the wetland areas around the highly developed waterfront sections in Buffalo, Rochester and New York City have been drained and filled.

Less direct, upland land use practices have also contributed to the loss of wetland and aquatic habitats. Vegetation removal, stream channelization, and certain farming practices have increased the variability of water temperatures and surface runoff. Increased fluctuation in surface runoff induces stream bank erosion and sedimentation in coastal tributaries. Important littoral areas used for fish spawning habitat are being blanketed with silt. The silty bay areas are then invaded by nuisance aquatic weed species which radically alter the ecology of the bay systems and thereby destroy vital habitats. Unfortunately, this pattern of habitat degradation is becoming increasingly common throughout the developed areas of New York's coastal region.

Toxic Substances and Other Pollutants

In New York, a critical problem is the contamination of fish, wildlife and their habitats with toxic and bioaccumulating substances, in particular, persistent organic pollutants (POPs) such as Polychlorinated Biphenyls (PCBs), persistent organic pollutants and insecticides, Dioxin, heavy metals such as (mercury and cadmium), microplastics, and some pesticides. These compounds enter the environment from industrial and municipal discharges, atmospheric fallout, leachate from landfills, or agricultural runoff.

Of particular concern is the accumulation and transfer of toxic substances in the aquatic food chain. For example, Mirex had been discharged into the Niagara River where it collected in the bottom sediments. Small invertebrates feeding on the bottom organic food materials directly ingest the Mirex. It then becomes increasingly concentrated at successive levels of the food chain. Unacceptably high concentrations of Mirex now exist in certain predator fish species such as salmon, lake trout, and smallmouth bass.

In 1976, New York State restricted the possession of these and other fish species caught in Lake Ontario and its tributary streams. Although these restrictions were replaced by a health advisory in March, 1978, the contamination of Lake Ontario fish by Mirex and other toxic compounds persists. In the summer of

1981, Dioxin was detected in Lake Ontario fish. The New York State Health Department has broadened the health advisory for eating certain species known to be contaminated with Dioxin.

An equally serious problem has occurred in the Hudson River where 440,000 pounds of PCBs were discharged into the River and these PCBs have contaminated the bottom sediments, as well as resident and migratory fish species. Cleanup costs for dredging the “hot spots” in the river were estimated to be approximately \$49.5 million. Today, commercial fishing for striped bass and the American eel is banned. Recreational fishing is also prohibited in certain portions of the Hudson.

The more conventional pollution problems created by combined overflows, failing septic systems, urban stormwater runoff, oil spills, discharge of vessel wastes and solid wastes, adversely affect fish, shellfish, wildlife and their habitats. These problems persist in areas surrounding the major metropolitan areas of the State such as western Long Island, New York City, Albany, Rochester and Buffalo.

Marine plastic debris, including microplastics (smaller than 5 millimeters), microbeads from cosmetic consumer products, plastic resin pellets used in manufacture of plastic consumer and industrial products, and microfibers from synthetic polyester and nylon clothing, can persist in the environment for centuries. Aquatic species including fish, seabirds, turtles and marine mammals, ingest microplastics, which accumulate in the gastrointestinal tracts and the circulatory system and can cause stunted growth, loss of body weight due to disruption of normal digestive and excretory functions, and eventual starvation. Endocrine disrupting chemicals manufactured into the plastics for desired consumer applications can produce adverse developmental, reproductive, neurological, and immune effects in wildlife and humans. Microplastics in freshwater and saltwater also attract and adsorb the hydrophobic pollutants like PCBs, DDT, and PAHs already present in coastal waters. When microplastics are ingested by aquatic species, the plastic and toxic chemicals become bioavailable throughout the food chain. Because of their small size and buoyancy, microbeads and microfibers are not effectively filtered out by wastewater treatment plants. Once microplastics are discharged into coastal waters, there are no known methods to effectively remove them from the aquatic environment.²⁰

Recreational Use of Fish and Wildlife Resources

Throughout most of New York’s coastal area, inadequate public access constrains present hunting and fishing as well as non-consumptive uses such as bird watching, wildlife photography and nature study. Posted lands, strip development, highways and railroads located along the coastline severely limit physical access to the marshes and estuaries which support valuable fish and wildlife populations. Substantial efforts have been made by State, county and local governments to improve access to these resources through acquisition programs and construction of boat ramps and dock facilities. However, increasing cost of land and construction materials and decreasing amounts of available public funding will limit future efforts to meet increasing demands for public access.

Commercial Fisheries Development

For years, New York’s commercial fishing industry has been sadly neglected. New York City, once a prominent fishing port, is used today as a home port by only one commercial fishing vessel. Although the Long Island commercial fishing fleet is still active, not one of the Long Island fishing ports is large enough to be included on the National Marine Fisheries list of the top 100 fishing ports. Commercial fishing in the Hudson River and Lake Ontario has been severely curtailed due to toxic substance contamination of the fishery resources in these waters.

However, a tremendous opportunity for expanding the State's commercial fishing industry was created with the passage of the federal Fishery Conservation and Management Act of 1976. This law provides U.S. fishermen priority rights to harvest the millions of tons of fish, previously being caught by foreign fishing fleets. To realize this development potential, New York must make adjustments in the harvesting, processing and marketing sectors of its fishing industry. Inadequate channel access and limited availability of docking, unloading, and processing facilities presently impede the growth of offshore, deepwater fisheries. An insufficient number of boat ramps, inadequate catch transfer sites, and lack of shellfish processing and gear storage facilities limit development of the near-shore fisheries. Also, it will be necessary to address and reconcile user conflicts between sport and commercial fishermen if growth of the fishing industry is to occur.

Another opportunity for increased commercial fishery development exists with the possible expansion of aquaculture. As a process very analogous to agriculture, aquaculture has been a practice on Long Island since the mid 1800's. By 1880, the Blue-Point Oyster had gained international fame. Approximately 10,000 metric tons of oyster meats were produced annually at the turn of the century.

Today, however, only a few of the original private oyster farms still exist. Some firms have converted their facilities to grow hard clams. One recently formed enterprise is experimenting with growing striped bass to marketable size for sale to restaurants. But current production levels of these high-value seafood products do not meet domestic and export market demand. Results of a recent study of the feasibility for expanding aquaculture activities on Long Island indicate that the constraints on aquaculture are primarily institutional and economic rather than technological. Limited access to capital, restrictive State and local laws and insufficient acreage of underwater lands available for leasing to aquaculturists are the primary constraints to future industrial growth.

FLOOD AND EROSION HAZARDS

Introduction

Flood and erosion hazards in the State's coastal areas can be classified into two types by location: along the exposed coasts of Long Island, New York City, Lake Erie and Lake Ontario and along the banks of its major rivers and tributary streams. The first category is the more crucial in New York State's coastal areas.

Flooding and erosion on the State's coasts are generated by powerful natural processes setting water and wind against the shorelands. To maximize their benefits from resources in the coastal area, people have often ignored or been unaware of those processes and have built structures on beaches, dunes, barrier islands, erodible bluffs, and flood plains, where they are subject to damage or loss, or cause harm to natural protective landforms. People have also attempted to defend their property against flooding and erosion by installing protective structures, many of which have been inadequately designed and constructed, and have caused damage to adjacent property. As a result, great economic loss and public expense have been incurred, and human lives endangered.

Beaches are the most valuable of the hazardous coastal landforms, because they are subject to the impact of both, wave and current energy, as well as continually rising sea levels in the tidal zone. In their natural state, with their movements unaffected by humans, beaches may be reduced in extent (erosion), rebuilt (accretion) or remain stable over time, depending on the varying power and direction of the agents acting upon them and on the type and availability of beach materials. Wave energy is the principal agent of change

on beaches although wind can also supply sediment to them or deplete them. Waves attacking a beach at oblique angles also generate longshore transport which, on extensive stretches of the State's coast, travels generally in one direction (for example, west to east on Lake Ontario, and east to west along Long Island's south shore). This redirected wave energy will carry beach materials along its path, periodically depleting beaches at one point and augmenting them at others. In some cases, as on Lake Ontario, the sand particles are eventually lost in deep troughs offshore and thus permanently removed from the process.²¹ The most extensive beaches in the State's Coastal Area are found on the barrier islands and "mainland" of Long Island, particularly along its south shore. Although the width of beaches on Lake Ontario and Lake Erie varies with the water levels of the lakes, for the most part the relative scarcity of sand in the coastal lands and, in the case of Lake Ontario, the sharp drop in the beach terrain offshore, have not permitted accumulation of beach materials to the same extent as on Long Island. Beaches are valuable as a first defense against storm waves.

Dunes are formed from sand blown by onshore winds from adjacent beaches and, except for the Deer Creek Marsh and Sandy Pond Marsh area on Lake Ontario, are found only on Long Island. They are constantly changing form, reaching a degree of stability only as vegetation establishes itself. Those on Lake Ontario are of special concern because they were formed thousands of years ago when the lake was at a lower level. Once destroyed, they will never reform because their source of sand is now underwater. Dunes are fragile and very susceptible to damage by human activities. Dunes have a high value as a second tier of defense against the powerful actions of storm-driven waters and as part of the shore system.

Barrier islands are a unique shore form, the most significant being found on Long Island at Fire Island and Jones Island. (Smaller scale barrier features are also located elsewhere on Long Island and at the mouths of several bays and streams of Lake Ontario). These long, narrow accumulations of unconsolidated materials comprise a beach fronting the ocean, a dune system, and tidal wetlands or beaches and bays on their landward side. The islands are separated by tidal inlets which help flush the inner bays. This combination of shore forms and natural coastal processes creates the most fragile and unstable of coastal lands which, because of their location, are most attractive for development. When unaltered by humans, barrier islands respond to natural forces by absorbing wave energy which, in major storms, is dissipated on the beach and over the dunes, with beach materials often being carried into the bay beaches or wetlands. Barrier islands earn their name in this way by protecting the waters of the inland bays and the shoreline of the "mainland".

After beaches, bluffs are the most prevalent landform in the State's coastal area. Erodible bluffs can be damaged by wave attack and by landward sources such as surface runoff and ground-water seepage. The degree to which waves contribute to bluff erosion depends principally on the geologic composition and structure of the bluffs, the strength of the waves, and the energy-absorbing capacity of the beach at the base of the bluffs. Strong waves, combined with high tides or lake levels which reduce the width and thus the protection provided by the beaches, will produce a high rate of bluff recession.

The attack on bluffs by landward sources can have an effect at least as severe as that caused by waves, and includes: groundwater seeping along permeable layers of sand, carrying soil with it; the gradual slippage of upper bluff materials along a clay stratum; and direct erosion of the-bluff face by runoff. The following estimates of annual bluff recession rates on the State's coasts reflect differences in the geologic composition of the bluffs, as well as the relative strength of erosion or other destructive agents at the bluff location: at Old Field Point on Long Island, 5.2 feet per year;²² on the Lake Erie shoreline of Chautauqua and Erie counties, from 0.5 to 1.1 feet per year;²³ and in the stretches of bluff in Oswego County on Lake Ontario, up to 2.35 feet annually.²⁴ Average annual recession rates, of course, do not necessarily mean that the bluffs

erode steadily at a fixed rate. In some cases, individual storms or slumping may remove land at many times the average rate.

Damages Resulting from Flooding and Erosion

On beaches, barrier islands, bluffs, and other hazard areas such as low-lying flood plain lands, humans have built houses and other permanent facilities. Measures of the hazard risks and of the large scale of investments made in those areas are suggested by the following examples. In March 1973, storm waves resulting from the action of strong northerly winds on a high lake level caused damage estimated at \$25 million to both public and private property along the New York shore of Lake Ontario.²⁵ As an indicator of extreme conditions, consider the historic event of Superstorm Sandy. Hurricane/Post Tropical Storm Sandy struck the New Jersey coast near New York City on October 29, 2012, inflicting billions of dollars of damage to residential and commercial facilities as well as transportation and other infrastructure along the coastline and well into the interior. Coastal New York City and Long Island were especially hard hit by Superstorm Sandy's impacts. New York state government estimated construction costs of \$41.9 billion to repair and replace the damage caused by the storm just in lower New York. The following is a description of the impacts in a Report by the City of New York:

Superstorm Sandy resulted in large numbers of people losing their homes, livelihoods, and in some instances, their lives. More than 10% of New York City's population (almost 850,000 people) lived in Sandy's Inundation Zone—over 325,000 dwelling units in 78,000 buildings (85% of which were built before 1983 flood-related building code upgrades, and over 60% of which suffered FEMA-inspected damage). The New York City Police and Fire Departments rescued more than 1,700 people, with likely many more unreported. While the vast majority in the region did not suffer to the degree as those in that zone, what did affect everyone unilaterally was the damage to our citywide systems: transportation and utilities, housing, critical and commercial buildings, and the waterfront. The energy infrastructure was damaged along the regional supply chain of fuel terminals, pipelines, and gas stations. Hundreds of thousands were without power—approximately 80,000 residents in more than 400 New York City Housing Authority (NYCHA) buildings were affected by loss of electricity, heat, or hot water. The storm revealed vulnerabilities across the Tri-State Area and focused attention on the question of long-term viability. Since October 2012, numerous initiatives are under way at local, regional, and federal levels to determine how to respond to future impacts from such storms, which are anticipated to happen with even greater frequency and intensity.²⁶

The effects of erosion and flooding, however, are not linked solely to catastrophic weather disturbances. For instance, the Corps of Engineers had calculated that annual damages along the 120 mile length of Long Island's south shore were in excess of \$30 million²⁷. In developing those hazard areas, private as well as public investments are threatened. The burden of maintenance or replacement of local, county or State facilities, and post-storm debris removal, necessitated by erosion and flooding, is borne by public funds. Thus, the drive to locate as close as possible to the shorefront has resulted in the commitment of massive private and tax-financed public expenditures in areas where it is subject to damage or loss.

An additional consequence of development on hazardous shorelands is that it may destroy natural protective landforms such as beaches and dunes which could absorb the energy of stormwater. Thus, inland development which otherwise would be considered outside the principal hazard zone may become vulnerable.

Damage from riverine flooding and erosion, while not of major proportions compared with that incurred on the marine and Great Lakes frontal shorelands, is significant. Some of the damage occurs on the banks of tributary streams at points near the coast where ice jams, or sediments carried down by the streams or by longshore transport, block their flows. In the narrow channels of the Hudson and St. Lawrence Rivers, erosion caused by ship waves is of concern. Residents on the St. Lawrence River are also particularly disturbed by the threat of erosion caused by the movement of ice resulting from the Winter Navigation/Season Extension Program now under consideration by the Secretary of the Army. The State has affirmed its opposition to the Program.²⁸ The State is not opposed to shipping on the St. Lawrence River at any time of year when ice conditions are not present. However, the State finds that adequate economic and environmental information does not exist to demonstrate the justifiability of any season extensions on the River which are defined solely by calendar dates.²⁹ The Program would have little economic benefit to the State while it would impose serious effects upon the management of levels and flows, fish and wildlife and their habitats, production of hydroelectric power, rates of shoreline erosion, and upon shoreline property.

Responses to Coastal Hazards

There are five types of responses to coastal hazards: (1) the building of protective structures, including those that use natural materials such as sand, to defend coastal property against damage by flooding or erosion - the “structural” response; (2) such actions as the planting of vegetative cover, the re-shaping of bluffs or, perhaps the most reliable approach to minimizing risk, the avoidance of the hazards by siting buildings in relatively safer locations - the “non-structural” response; (3) the purchase of insurance against the hazards - the “insurance” response; and (4) acceptance of the risk of damage to, and eventual loss of property - the “do-nothing” response. The fourth response is one not generally chosen deliberately by riparian owners, but rather forced upon them, most often due to their unawareness of the hazards, or because of their inability to pay for the other alternatives. And finally, (5) the community resilience response. The first three responses are often used in combination with one another, and also as part of a community resilience response.

The “Structural” Response

The most common type of structural response is the installation parallel to the shoreline of frontal protective devices against erosion or flooding. There are several difficulties associated with those widely used devices. Because of the great force generated by coastal processes, the structures must be soundly designed and constructed in order to be effective. However, one study showed that along the eastern end of Lake Ontario and the shores of the St. Lawrence River, less than half of the frontal structures inventoried were of more than limited effectiveness.³⁰ In addition, improperly designed frontal structures such as bulkheads, revetments and seawalls may accelerate the loss of beach materials as storm wave energy is focused on the beach. Thus, a natural shield may be lost. Difficulty also arises from attempts to protect a house located on a narrow stretch of shoreland. Because erosion may continue on the unprotected sides of the structure which are vulnerable to lateral wave attack, the useful life of an otherwise sound structure could be shortened considerably and erosion conditions on adjacent lands exacerbated.

Protective structures are not only used as defenses against direct frontal attack but also to prevent the loss of, and to build up, beaches. However, the process of littoral transport will add sand on the desired side of a groin or jetty only at the expense of beaches down current which, being deprived of their natural supply of sand, will be more subject to recession, thus eventually threatening buildings at that location. A

breakwater may create a similar effect by blocking wave energy and slowing littoral transport, thus causing sand to accumulate on the landward side of the structure.

One group of structural responses takes advantage of natural materials. Dune-building and the replenishment of beaches require sand in great quantities. Sand and gravel mining to meet the future needs of the construction industry is a potentially significant activity in the State's coastal waters. However, care must be taken to ensure that these materials are not obtained from sites, onshore or offshore, which are parts of the delicately-balanced coastal process. The particle sizes of the beach-building materials must also be compatible with the local beach environment or the investment will be lost.

The high cost of protective devices is another problem of the structural response. Because the cost of the most appropriate structure will vary with specific site conditions, the following estimates for a 100-foot stretch of shoreline are only illustrative: stone revetment, eight feet high - \$23,000; steel bulkhead, ten feet high - \$58,000; timber crib bulkhead, seven feet high - \$8,500.³¹ A further cost often overlooked by riparian property owners is that necessary to implement a program of maintenance for protective devices. Most structures, although built to reasonable standards and design, will succumb over time to the powerful forces of the sea or lakes and must be inspected and repaired to preserve their effectiveness. The long-term protective capacity design of devices, and thus their original cost may be reduced if property owners follow a prudent maintenance program.

A final cost consideration arises from the case cited above of the property owner who attempts to protect his own small length of shoreline. On a stretch of coast possessing generally similar characteristics of form, geologic materials, and exposure to waves (technically termed a "reach"), the most efficient method may be to protect the entire shoreline. This would require, of course, the agreement of all property owners on the reach to finance the undertaking. However, there may be economies of scale which could make it attractive.

An important aspect of structural responses to coastal erosion and flooding is public sector activities in providing costly large-scale structural solutions including major groin fields, bulkheads, beach nourishment, sand-bypass installations and dune-building. The federal government is the principal source of those activities with the United States Army Corps of Engineers assigned the greatest responsibility. Generally, the Corps is authorized to become involved in shore, hurricane and tidal, and lake flood protection studies and projects on the Great Lakes and marine coasts as well as in riverine areas. However, in the case of shore erosion and restoration projects, federal funds may not be used for the protection of private property unless it: (1) is incidental to the protection of public property; (2) would result in public benefits; or (3) is necessary to mitigate shore damages on private property caused by federal navigation works. An exception to this principle is sometimes made in the event of the threat of extreme flooding as in the Operation Foresight Program initiated during a period of high water levels in the Great Lakes area in 1972-73 through which emergency assistance was provided to private property owners.

The Corps of Engineers may also provide technical assistance to private property owners on flooding and erosion problems. Most Corps projects require cost-sharing with State and local governments for both construction and maintenance.

The largest Corps of Engineers coastal flood and erosion projects are undertaken on the State's marine shorelands principally because: the coastal processes there are more powerful; above mean high water, many of the beaches are in public ownership while almost all of them are owned by the State below mean high water; and shoreline development is more intensive. However, those projects often provoke

controversy reflecting disagreement as to their effects on shoreline resources as well as the substantial expenditures involved, particularly in regard to the State and local cost-sharing requirement.

Those elements are seen in the project to protect 83 miles of Long Island's coast from Fire Island Inlet to Montauk Point at an estimated cost of \$138 million (1976 prices). Only five percent of this project (authorized by Congress in 1960) has been completed by the placement of 17 of 50 proposed groins and 2,000,000 cubic yards of fill. However, the 15 groins in the Westhampton Beach area, while stabilizing the beach on the site, are alleged to have caused heavy erosion to the west and consequent storm damage to shorefront homes in early 1978. An interim project to cure this problem would cost initially \$42 million and an additional \$8 million every five years thereafter. The State's share of first costs would be over \$8 million while Suffolk County would be required to provide almost \$4 million.

Although many of the Corps' projects are single purpose (beach erosion, or hurricane protection), some are multi-purpose. On Lake Erie, a new project at Cattaraugus Creek is expected to reduce flooding upstream by preventing ice jams and longshore transport sedimentation at the mouth of the stream. The primary purpose of the project, however, is to create a harbor of refuge to protect recreation craft from storm driven waters. The Corps also has completed, or is investigating a few small projects which do not require Congressional approval: examples include the St. Columbans-on-the-Lake Emergency Bank Protection and Wendt Beach Park Shoreline Erosion projects.³²

The "Non-Structural" Response

The first component of the "non-structural" response is the strengthening of landforms and the use of appropriate design features in buildings as protection against flooding. A common technique of this type is the planting and careful preservation of suitable vegetation on dunes and on the top or on the face of bluffs to reduce erosion caused by wind, runoff or other agents.

This technique, however, does not prevent wave erosion and is often used in combination with frontal structures at the base of the landform. Other "non-structural" responses of this type include: sand-fencing on dunes to help build up and hold the sand; drainage systems on bluffs to prevent slumping and the formation of gullies; mechanically reshaping the face of bluffs to an angle of repose which will help prevent slumping, and the flood-proofing of buildings or their elevation above the base flood level.

The second component of the "non-structural" response to coastal flooding and erosion is the initial siting of development entirely out of the hazard areas. This method is the most economical as it avoids the various difficulties, including the high cost, of the "structural" approach. Yet it has not been widely followed by shorefront owners. Although this approach does not guarantee perpetual protection, it does significantly improve property owners' chances of reducing the hazard potential.

Some shore property owners with foresight, the necessary funds, and available land, are able to move their buildings out of the hazard zone before damage is incurred. Clearly, the less elaborate the building, the greater the savings; some cottages can be pulled to safety by a tractor while more substantial residences must be carefully and expensively transported.

The "Insurance" Response

Structural and non-structural measures and combinations thereof, are allowable alternatives under the National Flood Insurance Program which offers insurance against property damage caused by flooding and flood-related erosion. Property owners in a community which is participating in this program may purchase insurance, provided the local government regulates development in the flood hazard area. Regulation

includes requirements for flood-proofing of buildings and restrictions on their siting in the floodway. A special National Flood Insurance Program regulation is applicable only to identified Coastal High Hazard Areas on the marine coast which comprise lands subject to high velocity waters caused by tidal surges or hurricane wave wash. Designation of those areas has been made in the majority of communities on New York State's marine coast. The main requirements applicable to such areas are that new construction or substantial improvements must be: located landward of the mean high tide line; elevated above the 100-year flood level with space under the first floor to permit tidal or stormwaters to pass freely; and securely anchored. New mobile homes are prohibited. Additionally, alteration of sand dunes which would increase potential flood damage is prohibited. State-owned and State-financed facilities are subject to special regulations to ensure that public investment in flood hazard areas is carefully analyzed and appropriate steps taken to reduce the risk of damage and loss of life.

The National Flood Insurance Program also provides for the sale of insurance to property owners against flood-related erosion damage. However, the regulatory part of this program, which by law must include restrictions on building in flood-related erosion hazard areas, has not been initiated because the Federal Emergency Management Agency has not issued final regulations. The major obstacle is the difficulty in ascribing property damage to flood-related erosion as opposed to other types of erosion.

The Community Resilience Response

Coastal resilience is the capacity for a community and its ecosystem to anticipate, adapt to and work with—rather than fight against and attempt to control—natural processes, and especially extreme events like natural disasters. A resilient community assesses available information, environmental science and future uncertainties, and then develops ongoing adaptability to interconnected forces of unfolding climate change issues, impacts from ongoing coastal development, and broader socio-economic changes from globalization, especially when conditions, forces and risks are not completely predictable nor controllable. In the aftermath of a disaster, a resilient community quickly recovers the basic structure and functions of interconnected social, economic and ecological systems, and necessary and appropriate built infrastructure, and it is able to readily adapt to change. Rather than replace damaged infrastructure exactly as it was, the resilient community responds by adapting its thinking and practices to ensure viable ecosystem services and functions for the community. Incorporating resilience measures, including the use of natural infrastructure and natural processes, and avoiding investments that are not highly adapted to a changing climate, are keys to a community resilience response. New York State is committed to increasing the resilience of New York communities in its coastal area.

Lake Levels

A further coastal hazard issue pertains to high water levels on Lake Ontario and Lake Erie.³³

The International Joint Commission (IJC), established by treaty between the United States and Canada, exercises control over the rate of outflow from Lake Ontario, and thus influences the lake's level, by ensuring implementation of the "Orders of Approval for the Regulation of Lake Ontario" (which it issued for the operation of the St. Lawrence Power and Seaway Project in 1958). This document sets forth the range within which the lake level will be maintained, and the specific ways in which the interests of navigation, power and shoreline property owners are to be taken into account in regulating the lake's outflow. Direct responsibility for implementing the Orders of Approval has been delegated by the IJC to its arm, the International St. Lawrence River Board of Control (SLRBC). The SLRBC has developed a Plan of Regulation to provide a systematic framework for its decisions.

Since the March 1973 storm mentioned earlier, the lake's water levels have been more often in the upper part of the range set by the Orders of Approval than in the lower half. Coastal property owners, fearful of these continuing high water levels, have criticized the IJC and the SLRBC for their failure to lower them.

The property owners' criticisms are threefold. First, they claim that in its day-to-day examination of level and flow data and implementation of the Order of Approval, the SLRBC tends to favor navigation and power interests over shore property owners who have no direct representation on that body. Second, the shoreline residents claim that the regulatory plan and Orders of Approval are inadequate and should be re-examined to find ways to accommodate better the needs of shore property owners. Third, it is argued that the IJC should investigate the feasibility of changing the capacity of the St. Lawrence River to allow a greater overall rate of outflow from Lake Ontario and thus a greater flexibility for regulating its level.

At least partial satisfaction of the first criticism was achieved in 1981 when an official of the State's St. Lawrence-Eastern Ontario Commission was appointed to the SLRBC, replacing a representative of the Federal Power Commission.³⁴

A second action taken in response to these criticisms was the Lake Ontario Shore Protection Act of 1976 (PL 94-587, Section 180-a), which directs the Corps of Engineers "...to develop a plan for shoreline and beach erosion control along Lake Ontario" and "...include recommendations on measures of protection and proposals for equitable cost sharing, together with recommendations for regulating the level of Lake Ontario to assure maximum protection of the natural environment and to hold shoreline damage to a minimum." The first phase of this study was completed, but funding for the remaining two phases is uncertain.

The proposed Winter Navigation Program mentioned earlier is also of concern to lakeshore property owners because in addition to its other effects, the necessary ice breaking activities in the St. Lawrence River may increase the level of Lake Ontario.

Shoreline residents of Lake Erie have also been concerned about high water as, during the past decade, the mean monthly lake levels have rarely been below the long term average. As a result, flooding and erosion have caused damage along the coasts of Erie and Chautauqua counties although, because of their more erosion-resistant shorelands, the magnitude of erosion is not as great as that on the Lake Ontario coast. The IJC's Lake Erie Regulation Study Board recently completed an investigation of the feasibility of limited regulation of the lake and found that: "the magnitude of the losses as compared to the benefits is such that no reasonable changes in assumptions or evaluative techniques could result in net benefits approaching the cost of the Niagara regulatory works" necessary to implement regulation.³⁵

In response to the United States and Canadian governments' recognition of the need for a system-wide examination of levels and flows problems throughout the Great Lakes, the IJC established the International Great Lakes Levels Advisory Board (IGLLAB) in 1979. The U.S. and Canadian members of IGLLAB, who include U.S. Section Chairman Robert C. Hansen, Coastal Program Manager, NYS. Department of State, have been directed to: (1) find ways to increase public awareness and involvement in decisions regarding levels and flows; and (2) make recommendations to the IJC on actions which the Commission may wish to take regarding ongoing and proposed activities such as the regulation of lake levels and the Winter Navigation Program.

The lake level issue is complex. The fluctuating flow of waters into and out of the Great Lakes system has produced in the past both low and high water conditions causing varying amounts of damage to the many

interests which depend or front on the lakes' waters. The issue, therefore, is not how to avoid entirely loss to any one interest, but, rather how to ensure an equitable distribution of benefits among all interests.

Evacuation Needs

Climatological hazards such as hurricanes, northeasters, or seismic disturbances can seriously impact the coastal area. During the last 100 years, seven hurricanes have directly hit the coast of New York State, and several other hurricanes have affected the coast while passing offshore. The methods of dealing with storm surge, wind, and flooding associated with these natural hazards are addressed in the coastal management program policies, particularly policies 11-17.

Evacuation planning is a necessary component of Coastal Management, particularly when existing protection from natural hazard impacts is inadequate. The New York State Office of Disaster Preparedness has primary responsibility for evacuation planning. Department of State will work with the office to ensure adequacy of evacuation plans which may be necessary for coping with these natural hazards.

PUBLIC ACCESS

Introduction

Public access to both the recreational and aesthetic resources of the coast is a key element in the management of coastal areas in New York State. There are two principal components of public access: access to existing recreation resources; and, access to publicly-owned lands and waters of the coastline at large. The first is linked to the coastal recreation issue discussed separately in this section. Therefore, this public access discussion does not delve into the need for recreation facilities or resources, but focuses on problems in getting to these facilities and the coastline at large.

Access to the Coast at Large

There are two types of conditions which impede public access to those lands available for public use along the coast: development and private ownership of land which create human-made barriers to shorefront access; and natural shoreline topography or conditions which make access difficult or impossible. A large portion of New York's coastline is devoted to private residential, commercial and industrial use. Along much of this shoreline, the existing land uses effectively block physical and visual access to the shore, even where there are lands immediately adjacent to the shore as well as lands underwater that are publicly-owned. In other cases, owners of private property that is adjacent to the publicly-owned foreshore and underwater lands often legally and illegally restrict lateral access along the foreshore. Where public rights-of-way to the shoreline do exist, use of the shore itself is often restricted by private beach/no trespassing signs.

Transportation facilities are another major human-made barrier blocking access to the shore. Highways and railroads, both in urban and rural areas, often provide views of the shoreline and the water, but their presence usually makes it difficult to get to the shore. The railroad tracks and highways lining the Hudson River clearly illustrate this problem and indicate why the River has failed to fulfill its potential as a recreational amenity. The railroad tracks follow both shorelines for long stretches; highways are located adjacent to the river in cities such as Albany and Poughkeepsie. Where these conditions prevail, the Hudson, aside from its visual value, remains detached from the community. Moreover, where significant parcels of public land do exist between transportation rights-of-way and the river, one's ability to reach them is often restricted because it is either too dangerous to cross the right-of-way or too expensive to provide a safe crossing. The

need to provide safe pedestrian and vehicle crossings is becoming even more acute now that high speed rail travel has begun.

Similar conditions exist along Lake Ontario, where the Lake Ontario State Parkway is a distinct barrier to physical access to the shore. In New York City, highways hinder much of the access to the shore in all boroughs.

In many urban areas, there are numerous obstacles to increasing public access to waterfronts. In addition to industrial and commercial land uses, decaying piers, and abandoned buildings, unsafe neighborhoods have made the waterfront an undesirable location for almost any activity.

Opposition from the coastal residential community also serves to impede efforts to increase general public access to the shore. Community opposition, somewhat justifiable, is rooted in the fear that increased public access would lead to: (1) diminished individual enjoyment; (2) decreased value of private property adjacent to access points; (3) increased pollution, litter, and noise; (4) undesirable commercial development; and (5) intensified use conflicts as competition for waterfront space increases.

Visual access problems are caused by development patterns and specific structural designs that either block the coastline from view or intrude upon the scenic coastal landscape. The discussion on aesthetics contained in this Section deals with the particular problems of visual access.

Public access is also limited by natural shoreline conditions. Along parts of Lakes Erie and Ontario, Long Island, and the Hudson River, cliffs and steep slopes, while they provide great scenic value, preclude all but the most ambitious from shoreline use.

The nature of public ownership of underwater lands and the foreshore and the terms and legitimacy of their sale have a long and complex legal history. The rekindled public awareness of the value of coastal lands requires increased circumspection before the public lands along the shore are disposed of or existing public rights of access are restricted or constrained in any way.

Unfortunately, in a practice that still prevails, the State has sold off underwater lands and the foreshore without full consideration of the value of such lands for public use and access to the water. This should not be construed to mean that all sales must cease, but that each such proposed sale must be carefully evaluated from both a public interest and riparian rights standpoint. The public interest must include the concept that such lands can have value for public use and access to the water, and are held in trust.

Access to Coastal Recreation Resources

The other major component of the public access issue is access to existing or potential coastal recreation resources. A beach is the most commonly identified coastal recreation resource. People want to get to the coast to use beaches for swimming, sun-bathing, fishing, walking, or simply for enjoyment of scenery. A problem in many areas is lack of access to beaches. Thus, there is a need to identify existing and future beach areas requiring additional access. To aid in this identification, a technical definition of “beach” has been developed (See Public Access Planning Process in Part II, Section 7).

Various forms of coastal beaches are found in New York State. Steep headlands fronted by narrow beaches are common along Lake Erie, Lake Ontario, the Hudson River, and the Long Island Sound. Barrier complexes, formed by a sequence of long, narrow barrier islands or bars, separated from the mainland by a lagoon or marsh, are found along the south shore of Long Island and the Port Ontario-Ellisburg region of Lake Ontario. Sandy beaches fronting the continuous ridges of sand dunes are also common, especially

along the southshore of Long Island. Barrier spits are formed when littoral transport causes the projection of a sediment body into a bay; i.e., Rockaway spit and Southampton spit on Long Island. The bays and harbors that are found in many coastal areas of the State normally contain narrow beaches backed by bluffs or pocket beaches with associated dunes.

There are several factors associated with the concern for access to existing or potential coastal recreation resources. One relates broadly to transportation limitations and inadequate parking facilities. The lack of adequate public transportation to many coastal recreation areas effectively limits access for many people, particularly urban residents unable to reach facilities located in suburban or rural areas. In some areas, the lack of public waterborne transportation limits access to key barrier beaches, preventing them from being fully utilized for recreation. Related to this problem are the limited parking facilities found at many coastal recreation areas. Beaches are often closed, not when the facilities are crowded, but when the parking lot is full. In many instances, recreation areas could accommodate increased use by limiting automobile access and providing public transportation such as shuttle buses from remote parking areas.

Restrictions on use of public recreation areas to local residents exist in a number of coastal areas, such as along Lake Ontario and on municipal beaches of Long Island. These restrictions take the form of outright legal prohibitions against non-residents using the facilities, or more indirect means, such as restricting parking to residents only, allowing no parking on streets adjacent to beaches, and charging higher user fees for non-residents.

RECREATION

Introduction

Coastal areas are New York's most important outdoor recreation resource. Within these areas a narrow band along the shore provides a wide variety of water dependent and enhanced recreational activities. Coastal residents and visitors make the coast the most heavily utilized recreation area in the State. This activity is often intensive and is an important contributor to the State's economy, with many coastal communities depending on the recreation industry for their economic wellbeing.

The appeal and importance of New York's coasts for recreation creates several concerns. The principal issue is: how can the special qualities of the coastal area best serve the demand for recreation, while ensuring that other land and water use needs will be accommodated and that the natural resource base will be protected? Flowing from this broad issue are several more specific concerns. These include conflicts with other uses of the coast; overuse of existing coastal recreation areas; the deficiency of water based recreation in urban areas; conservation of historic and cultural resources; the particular needs of recreation boating and fishing; and the desire to promote the private sector's role in recreation.

Use Conflicts

Use conflicts are major barriers to coastal recreation. A number of land uses which require coastal locations restrict recreational use of the coast. For example, use of the shoreline for rail transportation on both sides of the Hudson River has limited physical access to the river. Yet, the economic and social value of the railroad is such that needs for recreation must be secondary to improved rail service. In urban areas, because the commerce and industry of an earlier day was heavily water dependent, many such structures occupied shorefront locations. A number of these facilities still remain, often in a deteriorated or dilapidated condition, and limit access to the recreation opportunities of the shore. The costs of their removal, where

absolutely necessary, or more preferably their rehabilitation are along with land acquisition often prohibitive to cities wishing to reclaim the land for parks and recreational use. However, structures such as existing piers are readily adaptable for recreational uses at reasonable costs. Other barriers to the enjoyment of coastal recreation include the presence of industrial plants, nearby sludge and spoil disposal heaps, pollution control facilities, and elevated transportation routes. In rural areas, residential development along the shoreline consumes potential public recreation space as well as blocks access to the coast.

Use conflicts also take the form of destruction of resources necessary for recreation. Poor water quality plagues existing swimming beaches and limits development in some coastal locations. Water pollution is also a major deterrent to the growing sport fishery in the State. Toxic chemicals, such as Mirex, polychlorinated biphenyls (PCBs) and mercury, have resulted in fishing bans on some species in the Hudson River and the issuance of health advisories regarding the consumption of fish from Lake Ontario. Air and noise pollution additionally limit the recreational appeal of waterfronts for many outdoor activities.

Natural coastal processes create problems for recreation. Shifting sand bars intermittently block the openings to bays, creeks and rivers, thereby cutting off boater access to the coastal waters. Thus, if boating access is desired, dredging of channels is necessary. Heavy seas erode beaches and sudden storms create hazards for boaters if harbors of refuge are not nearby. In addition, natural, and in some cases even artificial fluctuations in water levels can adversely affect fish resources by disrupting breeding habitats³⁶ and can severely reduce the size of beaches for swimming.

On the other hand, the intensity or nature of recreation activities may pose threats to natural resources. For example, an embayment or estuary, which is now a productive fish and wildlife habitat, may be an ideal location for a harbor of refuge, but the attendant noise and pollution from motor boats and marine activity may disrupt the fish and wildlife habitat. Recreation development may also have an adverse impact on the character of existing shorefront residential areas by encouraging increased activity levels, commercial development, and other conflicts with existing development.

Excessive Use

Each recreation resource has a maximum capacity. Over-use can impair the quality of the resource and the recreation experience. Thus, with the increasing number of people participating in coastal recreation activities, there is a potential for excessive use of the coastal resources of the State. Excessive use has a number of effects. It can frequently result in water and noise pollution. Fragile coastal resources such as wetlands and dunes may be damaged merely by excessive foot traffic or off-road vehicles. Other areas, such as islets and offshore rocks that provide protected bird sanctuaries are often disturbed by any human intrusion.

Most coastal recreation is seasonal due to climate and existing vacation habits. The coastal recreation season consists, for the most part, of weekends and the summer vacation months. This is an unavoidable complication encountered when providing parks and recreation facilities for a large population.

Urban Area Needs

In New York State, urban areas generally exhibit the greatest recreation deficiencies along with the highest use of existing facilities. Poor water quality, restricted coastal access, high development costs, and many alternative demands for limited space severely restrict attempts to overcome these deficiencies. The needs of the poor, elderly, and handicapped are particularly affected.

Historic and Cultural Resources

New York State is rich in historic, archeological, and cultural resources which are important for their recreational as well as aesthetic and educational value. Unfortunately, there is yet no program or law to prevent the owner of a significant historic resource from impairing its historic character or demolishing it. Many significant historic sites have already been destroyed. Other sites are threatened by deterioration, lack of maintenance, and encroaching adjacent incompatible uses.

Recreational Boating and Fishing

Boating and fishing are significant recreational activities in the coastal waters of New York State. The fundamental requirement is to provide safe and desirable facilities to accommodate the demand. While some areas have adequate facilities now, growing demand indicates increased deficiencies in the future. A recent study indicates future growth in recreational boating in the Great Lakes basin area.³⁷ The Department of Environmental Conservation has initiated a fish stocking program in both Lake Erie and Lake Ontario. This also promises to increase demand for boating facilities. A boating survey indicates the marina industry on Long Island is grossing \$55 million annually, yet marina facilities are being lost to other more profitable land uses.³⁸ At the same time, existing facilities are not meeting current demands. Public and private marinas report backup lists of 200-300 requests. Furthermore, an undocumented but apparent trend seems to indicate that demand for small boat launching sites to service smaller boats is growing. In New York City in particular, the high costs of boat ownership combined with an inadequate number of marina facilities discourage recreational boating in spite of the opportunities that exist in the waters around the City for enjoying this activity.

New York State has the potential for developing one of the best sport fisheries in the nation (cf. section on *FISH AND WILDLIFE*). Realizing this potential will require the provision of adequate support facilities at the shoreline. Among the facilities needed are a sufficient number of “Harbors of Refuge” along the shoreline of the Great Lakes. These harbors must be provided at suitable intervals to assure safety in the event of rapidly developing inclement weather. In addition, adequate public marina facilities, including boat launching ramps, docks and storage areas, are needed to serve the sport fishermen.

Public vs. Private Ownership

Both the public and private sectors provide recreation facilities. In most cases there is little or no overlap. For example, lodging is generally provided by the private sector and large developed beaches are generally accepted as a public responsibility. Where government and private enterprise are providing the same type of facilities, they usually serve different markets. However, in some instances, direct competition has developed. This can create economic problems for private enterprise and ultimately less service to the public. For example, in the Buffalo area, several firms lost a significant number of their customers to a recently constructed state-owned marina. On the other hand, in some areas of the State, public marinas have attracted additional boats to the area, and boatyard owners have concluded that public facilities actually helped their businesses.³⁹

Often the laws and practices of the various levels of government have inhibited or at least not promoted cooperation with private enterprise in the provision of recreation facilities. Many jurisdictions do not permit the development of commercial facilities on public parkland.⁴⁰ The term of a lease to a private individual that a municipality may grant for operation on public land is limited by State law. Since large recreation facilities require a long amortization period, this limitation has discouraged private investment in some aspects of public recreation.

Because both public and private investment is necessary to ensure adequate recreation opportunities, the State must continue to address the issue of how to assure that a mutually beneficial relationship evolves between private and public investment in recreational facilities.

SCENIC QUALITY

Introduction

Of the shoreline's many attributes, coastal scenery is perhaps the most universally appreciated. At least three basic characteristics contribute to the visual quality of coastal landscapes: water in its many moods; dynamic coastal landforms; and expansive views. This environment attracts wildlife of all forms which also contributes to the aesthetic quality of the coast. To a degree, even the more ordinary coastal landscapes possess these attributes.

In great part, scenic resource studies have concentrated on natural characteristics. This emphasis results from the perception that natural landscapes are more visually pleasing than man-modified environments. However, in many locations, humans have changed coastal landscapes in ways which harmonize with or even enhance their natural scenic qualities. Old fishing villages, rolling farmlands, and dynamic city skylines are examples of human intervention that has added character and interest to coastal areas.

Beyond their inherent worth, scenic attributes of the coast augment other values. They combine with recreational possibilities to make the coast a prime location for vacationers and thus offer the potential for growth of the tourist industry.

We have long recognized the importance of scenic resources for recreational, psychological, educational, and economic purposes. In 1972, Congress gave coastal aesthetic quality even greater importance through the Coastal Zone Management Act which states:

The Congress finds that the coastal zone is rich in a variety of natural, commercial, recreational, industrial and aesthetic resources of immediate and potential value to the present and future well-being of the Nation.(§302(b))

Similarly, the New York State Legislature in the Waterfront Revitalization of Coastal Areas and Inland Waterways law has found that:

New York State's coastal area is unique with a variety of...aesthetic resources of statewide and national significance. (§910)

Degradation of Scenic Resources

While the New York State Legislature has recognized the value and benefits of scenic resources, its concerns are frequently not translated into real protection and enhancement of these resources. Instead, large and small-scale development projects often ignore and degrade natural coastal landforms and attractive human-made features. Large-scale development--whether industrial, commercial or residential--has a greater chance of impairing aesthetic value, but even a single prominent structure can significantly affect the scenic quality of an area.

Other degrading conditions may accompany development and reduce the aesthetic quality of the coast. Such unattractive conditions include: deteriorated buildings and piers, billboards and signs, power lines, transportation networks, litter, and visible air and water pollution.

The most complete degradation occurs when development blocks views of coastal waters. In urban areas, the problem is especially serious, because few visual access points remain. But the problem exists as well in rural areas where linear residential and commercial development often spreads to prevent visual access for all but shorefront property owners.

Protection of Scenic Quality

In order to protect scenic quality, the characteristics of scenic landscapes must be more completely considered during the course of making development decisions. Scenic quality assessment and protection is a relatively new and complex field. The complexity results from the uniqueness of each landscape area and from varying opinions about what constitutes scenic beauty. Even where there is agreement about the outstanding quality of a given resource, there may still be varying opinions about what would seriously impair this quality.

As a result of the many complexities and differing opinions, scenic resources have been unsystematically inventoried and assessed; as noted above, they have often been disregarded altogether when development decisions were made. To assure more complete consideration of scenic quality, the State Coastal Management Program will identify certain significant coastal resources and will provide more specific guidelines for protecting and enhancing scenic quality. Local, State and federal agencies will, thus, be able to more fully consider the potential effect of proposed developments and avoid despoiling coastal scenery.

AGRICULTURE

Introduction

Agriculture is New York State's largest industry, with 1979 sales of \$2.2 billion.⁴¹ Dairy farming accounts for more than 50% of these sales.⁴² Fruit and vegetable production, the second largest source of income, accounts for 13% of the total. To produce this wealth, New York farming occupies 8.7 million acres, of which 35% (3.0 million acres) are in the coastal counties. These counties are the primary location of the State's important fruit and vegetable farming, which in 1978 had a market value of \$240.5 million.

While only a small portion of the agricultural land in coastal counties is devoted to fruit and vegetable farming, it produces nearly 10% of the total market value of all agricultural products produced in New York State. Because of the positive climatic influences of coastal waters, most of this farming, particularly the one devoted to fruits, is concentrated in areas immediately adjacent to the coast.

Loss of Agricultural Lands

Although the latest U.S. Census of Agriculture⁴³ reveals that, for first time in decades, the amount of land devoted to farming in New York has not decreased, the following factors indicate that the preservation of good farmland is a continuing problem for the State. Since 1945 nearly half of the land then being farmed has been lost to other uses. Though much of this loss is irrevocable, it is not all so. And while it is understandable that a highly urbanized state might not, or need not, be self-sufficient in food production, New York's present very low level of self-sufficiency increases the cost of food to the State's population and the State's vulnerability to agricultural calamity elsewhere. Finally, while the trend toward continual loss of land in farming may now not be alarming for New York State, the trend is not consistent across the State. Much land in the State is continuing to go out of production, often in areas that possess the most agriculturally significant land. These lands produce crops that are a unique or significant part of national food production e.g., grapes, sour cherries, carrots, and onions. In two of the three important fruit growing

areas along the coast, land in orchards has declined. Along the southern shore of Lake Ontario from Niagara to Wayne County, land in orchards has declined by 13.3% between 1969 and 1978. In the Hudson Valley the principal fruit growing counties of Columbia, Ulster, and Dutchess have experienced 5.3% decline in orchards over the period. In Chautauqua County, however, there has been a 20% increase in the amount of land in vineyards. In Suffolk County, where much farmland is near the shore and where farming has consistently generated the highest market value of farm products of any county in the State, land in farming has declined by 16.4% between 1969 and 1978.

While there is widespread recognition of the problem of the loss of farmland, mechanisms for addressing the problem remain at issue. To be effective, programs to preserve agricultural land must be comprehensive and authoritative, yet they must also be adaptable to changing market forces and responsive to the legitimate property interests of farmers.

Urban development, as it expands outward into farming areas, is the major cause of farm loss. In addition, land goes out of farming at the urban/rural fringe for the following often interrelated reasons: 1) Farming is dependent on nearby agribusiness enterprises; these, in turn, require a minimum number of active farms. Once a certain number of farms cease production and the level of agribusiness is reduced, the economic viability of the remaining farms is in question. 2) The proximity of an urban labor market begins to provide alternative employment opportunities to farmers and farm laborers. 3) In urban/rural fringe areas, local ordinances often restrict farm operation. 4) Declining or low net farm income and high inheritance taxes⁴⁴ are factors in the loss of farmland. 5) Urban land values raise local property taxes to levels beyond what is appropriate for its value for agricultural use. And, 6) Major public infrastructure investment can accelerate or direct urban growth into farming areas.

Definition of Important and Valuable Farmland

Different approaches to identifying important farmland have been taken. Howard Conklin's 1968 study⁴⁵ rated farms based on high, medium, and low economic viability. The State Development Plan⁴⁶ restructured this identification into categories referred to as exceptional, high and medium viability farming areas. The Soil Conservation Service identifies soils according to several categories of capability and also has a system for identifying important farmland as prime, unique, or of statewide or local importance. In a report prepared for the State '701' Land Use Element, the Agricultural Resources Commission recommended that "No one all-encompassing definition of important farmlands is practical or desirable." Rather, the Commission recommended that agricultural land use policy be based on various combinations of information about soil quality, economic viability of farming, climate, and existing land use patterns. This recommendation was considered the best approach. Therefore, for the operation of the Coastal Management Program, important farmland has been defined⁴⁷ as: 1) those lands which meet the United States Soil Conservation Service's criteria as being prime, unique, or of statewide importance; 2) active farmland within Agricultural Districts; and 3) agricultural areas identified as having high economic viability.⁴⁸

ENERGY

Introduction

New York State recognizes the need to develop energy resources, particularly those that contribute to achieving the State's energy goals. New York's coastal region plays an important role in furthering these goals and satisfying the energy needs of the State. It provides sites for numerous energy facilities, including

steam-electric generating plants; hydro-electric generating plants; electric and gas transmission lines; and renewable energy facilities. Developers of energy facilities typically prefer locations near the coast or offshore for one or more reasons: (1) access to shipping corridors for delivery of generation and transmission components, fuel; (2) proximity to the consumers of energy and submarine energy transmission cables; (3) availability of high volumes of cooling water for electric generating plants; (4) use of water for direct production of marine hydrokinetic energy (including hydropower, wave and current); and (5) strength and consistency of offshore wind resources relative to land-based wind resources.

Some energy facilities depend on coastal or offshore locations in order to function, while others, such as closed-cycle power plants, are able to operate at sites inland from the shoreline. Therefore, in view of the competition among many types of uses for shorefront locations, proposed energy facilities must be carefully studied to determine their dependency on coastal or offshore sites and resources. In addition to technical requirements, other factors must be considered, including public need, environmental impacts, abundance of the resource, and construction and operation costs of various site alternatives.

One special issue concerns ice management practices. The annual placement of an ice boom in the Niagara River, for example, is essential to protect power facility water intakes from ice jams and simultaneously to safeguard downstream shorelines from excessive ice scouring and flooding. The timing of installation and removal of the boom, however, must be carefully considered to ensure the greatest benefits from its use. In other instances, skillful control of ice formation helps avoid loss of power production crucial to the State's renewable energy goals and economic growth while reducing the risk of flooding and erosion damage.

Another special issue is the production of greenhouse gases from the burning of fossil fuels. The build-up of greenhouse gases is a major contributor to anthropogenic climate change. It is New York state policy to cap greenhouse gas emissions, and continue to make reductions in emissions through energy efficiency measures, adoption of new energy technologies that reduce harmful emissions, and the transition to sustainable renewable energies, including wind, hydropower, solar, biofuels, and hydrokinetic energies.

The New York State Coastal Management Program (CMP) recognizes that any energy development may have both positive and negative effects on existing uses and resources. Effects from energy development can occur in the biogeophysical environment as well as in social and economic contexts. These effects are not only from the development of locally produced energy, but also from transmission projects importing energy from out of state and the regional, national and even global nature of emissions impacts from out-of-state generation.

Possible impacts of energy development on coastal resources include the following:

- Chemical, thermal, radioactive and particulate emissions and discharges into the air and water proximate to the coast, including atmospheric deposition into waters that eventually deposit into benthic sediments that may be later dredged, disturbed or otherwise repeatedly resuspended;
- Entrainment, impingement and thermal shock of fish resulting from the operation of various types of steam-electric generating plants withdrawing enormous volumes of coastal water and the biota living within it;
- Alteration of landforms and vegetative cover; depletion of seagrass beds and wetlands; degradation of scenic resources;
- Possible risks or hazards from electric transmission lines, fuel pipelines, and hazardous nuclear or petroleum fuel delivery by rail, truck or ship;

- Spills, explosions and fires associated with petroleum, LNG, spent nuclear fuel or nuclear waste storage or processing facilities, and vulnerability to the risks and effects of powerful storms, earthquakes, sea level rise and coastal flooding, electromagnetic pulses (EMPs) and power outages, mechanical and structural failures due to aging infrastructure, and terrorist attacks;
- On-shore land use conflicts, offshore spatial conflicts, and disruption of underwater habitats from possible offshore energy development and transmission corridor placement;
- Increased greenhouse gas emissions, especially carbon dioxide (CO₂), methane (CH₄), ozone (O₃), and nitrous oxide (N₂O), which are contributing to climate change impacts affecting New York's coastal areas now and long into the future.

Coastal and Offshore Energy Development

The State's coast plays a role in supplying additional offshore sources of energy. However, significant environmental issues could be associated with offshore energy development in the Great Lakes, Long Island Sound or the Atlantic Ocean, including, for example, impacts on important fish wintering grounds and migration routes, and discarded equipment resting on the ocean bottom posing a threat to fishing trawls. Drilling and dredging operations, and the placement of underwater pipelines, cables and wind turbine substructure and foundations would result in increased localized turbidity and resuspension of legacy industrial contaminants due to disturbance of bottom sediments or dredged material disposal mounds and disposal of drilling mud. These operations could have temporary or long-term adverse effects on benthic organisms and the marine food chain. Significant fish habitats and spawning areas could be threatened. Damaging impacts would result if construction operations disturbed and re-suspended toxic wastes which were previously dumped in the area.

Another risk of offshore energy development is the possibility of accidental fuel spills during transport or transfer operations. Major or minor spills could adversely affect fish, wildlife and vegetation in the coastal area, or impact drinking water intakes, aquaculture areas, or water intakes for power plants. Control and cleanup of fluid or material spills in New York's coastal areas can be challenging and risks are expected to increase under severe weather conditions and increasingly frequent and powerful coastal storms exacerbated by climate change. Oil spills could not only damage shore and near-shore natural resources but also drastically impact the economic health of New York's multi-million dollar fishing, tourism and recreation industries. A spill during seafood harvesting or vacation periods could be devastating. In addition, potential energy development operations in the OCS pose navigational risks to ships transiting the shipping lanes.

Finally, any onshore energy support facilities sited in New York's Coastal Area are expected to have both beneficial and adverse impacts. The primary public benefits might include maintaining a reliable energy supply, creating jobs, redeveloping an underutilized waterfront site, creating contracting opportunities for local small businesses, reduction in carbon emissions, and generating tax revenues. On the other hand, a fuel supply storage facility might generate excessive noise, increase air and water pollution, and reduce navigational safety due to increased shipping traffic congestion.

The Five Year OCS Oil and Gas Leasing Program for 2017–2022 does not contemplate any exploration and development activities in the Atlantic, including the federal Atlantic waters offshore New York. However, renewable energy resources including wave, tidal, ocean current, and especially wind located offshore New York are an increasing focus of sustainable coastal development interest, and are now technologically feasible. Since New York State has particular interest in advancing the appropriate

development of viable offshore energy and identifying those areas important to New York's coastal industries, New York's coastal management plan will support the responsible and appropriate advance of offshore renewable energy development.

Marine hydrokinetic and offshore wind proposals have been made to state and federal entities responsible for leasing underwater lands. The State of New York considers offshore renewable wind energy development as a use which depends on the utilization and production of wind resources found at sustainable levels only in New York's coastal waters. The State's renewable energy policies generally recognize offshore wind energy projects directly interconnected to the New York electrical grid as qualifying for eligibility at the same level as though they were located within the State. Any assessment of project appropriateness should be based on the State's established policies and goals for reduced greenhouse gas emissions, and sustainable, resilient, and renewable energy generation, transmission, and use.

Furtherance of State Clean, Renewable and Resilient Energy Policy Goals

New York's energy policy is central to how the State responds to the challenges presented by a changing climate. Mitigating climate change is a global challenge, but New York can seize the opportunity to lead and realize the local benefits from the transition to a cleaner energy system and more productive economy. Several of New York State's existing statutes, directives, and state level policies encourage the responsible and appropriate development of clean, renewable energy generation, including the New York State Energy Law Article 6; the 2015 New York State Energy Plan (as authorized by NYS Energy Law Article 6); State Smart Growth Public Infrastructure Policy Act; Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014); Article 10 of the Public Service Law (enacted by Power New York Act of 2011); and the Regional Greenhouse Gas Initiative. Taken together, this array of policies shows a clear policy pathway for the development of clean and renewable coastal and offshore energy in New York because of the many and varied public benefits.

The 2015 New York State Energy Plan is a comprehensive roadmap to build a clean, resilient, and affordable energy system for New York. As a result of the implementation of the 2015 New York State Energy Plan, New Yorkers will have cleaner, more resilient, and more affordable energy, and will have taken significant actions to reduce petroleum consumption. The State Energy Plan puts forth strategies for facilitating and accelerating the use of low carbon energy sources, carbon mitigation measures in order to reduce greenhouse gases, energy conservation and efficiency measures, deployment of renewable energy generation, including large-scale renewables, and inclusion of alternate fuels like ethanol and other biofuels. The State Energy Plan is also concerned with promoting environmental justice and minimizing public health and environmental impacts, especially environmental impacts related to climate change.

The 2015 New York State Energy Plan, authorized by New York Energy Law Article 6 follows statutory criteria to guide state energy policy. According to Energy Law Article 6 (§ 6-104)), the State Energy Plan must include: "An inventory of greenhouse gas emissions, and strategies for facilitating and accelerating the use of low carbon energy sources and/or carbon mitigation measures." The law also requires that State agencies comply with strategies for facilitating and accelerating the use of low carbon energy sources, and New York Energy Law Article 6 mandates that the state energy plan be used to "provide guidance for energy-related decisions" made by the public and private sectors within the state. According to New York Energy Law Article 6, "any energy-related action or decision of a state agency, board, commission or authority shall be reasonably consistent with the forecasts and the policies and long-range energy planning

objectives and strategies contained in the plan.” Furthermore, New York Energy Law Article 6 requires that any state agency, board, commission or authority “may take official notice of the most recent final state energy plan...prior to any final energy-related decision by such agency, board, commission or authority.” Article 6 requires state agency decisions to be consistent with the State Energy Plan.

The State is also committed to reducing its greenhouse gas (GHG) emissions, 89% of which stem from New York’s energy sector. Cutting these emissions and other pollutants to protect public health and welfare is one of the primary objectives. The GHG reduction strategy is fueled in part by New York’s leadership role in the Regional Greenhouse Gas Initiative (RGGI), the regional and inter-state cap and trade greenhouse gas emissions reduction program, which requires owners of fossil fuel fired power stations to acquire CO2 emissions allowances, with the goal of reducing emissions over time by slowly lowering the allowable emissions cap. New York’s GHG reduction strategy is also driven by the new federal Clean Power Plan regulations issued by the U.S. EPA under section 111(d) of the Clean Air Act, which will require a further reduction of approximately 44% in the CO2 emission rate of New York’s power sector by 2030. Although EPA’s targets for New York may be revised in response to public comments, the State will likely have to implement additional actions to meet this challenge, including further adjustments to the RGGI program.

The 2015 State Energy Plan sets forth aggressive targets for GHG reduction, renewable energy, and energy efficiency. The State Energy Plan establishes three statewide clean energy targets to be met by 2030:

- (1) a 40% reduction in GHG emissions from 1990 levels, with an 80% reduction by 2050;
- (2) 50% of electricity generation will be from renewable energy sources; and
- (3) a 600 trillion BTU increase in statewide energy efficiency.

The State Energy Plan recognizes that extreme weather events demand more resilient energy infrastructure, so reliability is also a central objective of the State’s energy system. Power outages across the country are lasting longer, resulting in greater economic losses each year. The growth of the digital economy means that even momentary blackouts can have significant impacts on businesses and residents. The threat of extreme weather events and other climate change impacts is multiplied by aging infrastructure systems across the State, posing additional risks to the reliability of energy infrastructure and supplies. Continued investment in the maintenance, repair, and upgrade of the State’s generation and transmission systems is an essential component in improving New York’s infrastructure reliability and resiliency. Continued investment to upgrade and modernize the existing transmission and distribution system and infrastructure is critical. Resilience is also a prerequisite to the reliability of New York’s energy system, and the State Energy Plan will facilitate the development of innovative community microgrids, which incorporate clean distributed generation and storage sources that connect critical facilities. This will enable critical facilities to operate independently of the central grid during power outages and to operate as a cost-effective complement to the grid under normal circumstances. New York’s Smart Growth Public Infrastructure Policy Act of 2010 requires that state agency infrastructure decisions also be consistent with the ten goals of Smart Growth. Public infrastructure projects must conduct a smart growth impact statement (SGIS) that outlines adherence to relevant smart growth criteria, including the reduction of greenhouse gases.

The Siting of Major Electric Generating Facilities, authorized by the Power New York Act of 2011 (New York State Public Service Law Article 10), provides power project developers a streamlined siting process, and reduces the major energy generation facility review threshold down to 25-megawatt or more. This provides an opportunity for smaller generation projects, such as wind, solar and other renewable project

developers to take advantage of the streamlined siting process. An Article 10 energy generation licensing application must include descriptions of: the facility's environmental setting; potential environmental, health, and safety impacts; cumulative impact analysis of air quality and emissions; socio-demographic description and environmental justice analysis of the community; alternative locations for the facility; demonstration of consistency with State coastal policies, and measures to minimize environmental impacts. This policy, including the application process and the reduced energy generation capacity threshold, facilitates siting of renewable energy generation facilities.

WATER RESOURCES

Introduction

One of New York State's major assets is its abundant water resources available to meet domestic, commercial, and industrial water supply demands. The tourist industries thrive in the Eastern Ontario and Long Island regions of the State because of the distinctive water recreation and scenic values of these areas. Vast quantities of high quality water from Lake Ontario proved to be a key incentive for locating several breweries in upstate New York. The natural, deep-water harbor at New York City and the Hudson River provide an important transportation artery linking the Atlantic Ocean and upstate New York.

New York State is committed to protecting and developing its water resources. Since 1962, the State has spent about ten million dollars to develop comprehensive sewerage studies. Under the Pure Waters Program established in 1965 and subsequent bond issues, voters have authorized nearly \$1.7 billion for construction of sewage treatment facilities.

In 1975, the State, after bringing its long standing pollutant discharge control program into conformance with requirements of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972 (PL-92-500), established the State Pollutant Discharge Elimination System (SPDES) which, like its predecessor programs, regulates municipal and industrial discharges into surface and groundwater of the State.

Under the FWPCA, the State has also conducted basin wide water quality surveys (303(e)) and area wide water quality management (208)⁴⁹ studies. These studies provide a reassessment of the State's water quality problems and management needs. Of the six primary water basins with greatest water quality management problems, four of them encompass New York's entire coastal frontage. In addition, these studies indicate that although the State has been able to make great strides in controlling water pollution from raw sewage and easily discernable industrial wastes, there remains an even more complex set of water quality problems including toxic substances, surface runoff and residual wastes. These problems are nationwide in scope and their significance went unnoticed until previously unregulated point source pollutants were eliminated. More attention has been given to such pollution problems under the 1977 amendments to the FWPCA (the Clean Water Act, PL 95-217).

Integration of State water quality and coastal management programs are precisely what was intended by Congress under Section 307 (f) of the Coastal Zone Management Act of 1972, as amended. This section specifies that water quality management requirements developed under or pursuant to FWPCA, as amended, shall be the water pollution control requirements applicable under such coastal programs.

Industrial Wastes and Toxic Substances

New York State presently regulates the direct discharge of industrial wastes into surface and groundwater through its State Pollutant Discharge Elimination System. Most of these wastes must be treated before being

discharged. The effectiveness of this permit program is dependent on the availability of the information pertaining to the relative toxicity and the technology to treat these wastes. Without this information, certain chemical wastes may be unknowingly discharged into the environment in amounts greater than should occur, only to be discovered later to have dangerously adverse health effects. Such has been the case with the toxic industrial chemicals, Mirex and PCBs which have created serious biological consequences in Lake Ontario and the Hudson River. Presently, the annual proliferation of new chemicals creates a tremendous challenge to State and federal governments' efforts to monitor their production and distribution, establish discharge tolerance limits, develop treatment technologies and regulate their discharge into the environment.

Municipal Sewage Treatment

Through the State's 208-Program, the twenty-year population projections used for determining municipal waste water treatment needs have been updated, refined and disaggregated to a minor civil division level. Procedures are being developed to ensure that facilities planning and design will be consistent with these revised projections. The construction of new and upgrading of existing municipal sewage treatment plants is funded with monies made available by the State Environmental Quality Bond Act of 1965 and Section 201 of the Federal Water Pollution Control Act (FWPCA).

Unfortunately, there have been construction delays due to difficulty in financing the local share; length of lead time required for planning, design and site preparation; delays in the processing of applications; and increasing costs. Hence, partially treated sewage is still polluting the State's waters, particularly in the vicinity of large metropolitan areas. Recent budget cuts for the federal Construction Grants Program may even further delay construction of sewage treatment plants scheduled to be built. It should be noted that the federal Environmental Protection Agency and Congress are considering a reduction in the biochemical oxygen demand (BOD) standard from 85% to 50%. If this lower standard is adopted, the cost of treatment facilities that meet this requirement will be less, thus reducing future construction delays.

Because of rising costs, conventional sewage collection and treatment systems may not be economically feasible in many small coastal communities and rural areas. In many of these areas, failure of on-site septic systems or absence of sewage treatment has resulted in excessive nutrient enrichment of surface waters, groundwater contamination and sanitary problems.

Urban Stormwater Runoff and Combined Sewer Overflows

As New York State has progressed in treating industrial and municipal point sources of pollution, the relative significance of the pollution effects of urban stormwater runoff and combined sewer overflows has become more apparent. In many of New York's major urban areas, a single sewer system collects and transports sanitary sewage and stormwater runoff to the municipal treatment plants. During storms, the volume of flow through the system exceeds the plant's treatment capacity. The excess, therefore, is not treated and is discharged directly into the receiving waters. Such discharges include nutrients, coliform and pathogenic bacteria, organic wastes, lawn and garden chemicals, animal wastes, petroleum wastes from streets and parking lots, road salt, garbage and other assorted debris. Even where separated storm and sanitary sewer systems are used, such as on Long Island, untreated waters are discharged from the storm sewer systems with high levels of many of the same contaminants.

Untreated discharges have forced the closing of public beaches near Rochester, restricted shell fishing on Long Island, reduced dissolved oxygen levels in the New York and Buffalo Harbors, and may be contributing to degradation of groundwater on Long Island.

A major constraint to addressing the problems created by urban stormwater runoff and combined sewer overflows is the expense of structural control measures such as the installation of separate sewer lines, large underground storage systems or construction of large catchment basins. At present, federal financial assistance is not available for constructing stormwater treatment facilities. Non-structural methods, such as control of lawn and garden chemicals and pet control ordinances, may prove difficult to enforce, because they often depend on voluntary citizen compliance.

In some parts of the coastal area, such as Long Island, there are close relationships between stormwater runoff and groundwater quantity and quality. These issues are discussed further in the sub-section on “Groundwater”.

Agricultural Runoff and Wastes

In recent years there has been considerable controversy over (1) the relative magnitude and significance of the pollution of State waters generated by agricultural activities and (2) the determination of which management practices are most cost effective in mitigating the water quality impacts of agricultural operations. The non-point water quality problem associated with agricultural practices is the transport of nutrients, pesticides, herbicides, organic matter and sediment by storm runoff into surface waters. Silting in of fish spawning habitats, excessive growth of algae or rooted aquatic plants, decrease in dissolved oxygen concentrations and contamination of certain aquatic organisms are impacts associated with this water quality problem.

The variability in data from recent rural non-point studies makes it difficult to formulate a clearly defined cause and effect relationship between a given agricultural practice and an associated water quality impact. A case by case examination of potential problem areas and application of “Best Management Practices” for specific problems at a given site is presently the most practical approach to handling agricultural and other rural surface water runoff problems.

Vessel Wastes

Commercial and recreation boat discharges of shipboard wastes (e.g., sewage, garbage, bilge and cleaning wastes) degrade surface water quality, particularly in enclosed embayment and estuaries where diluting water volumes are low and vessel usage may be high. Serious public health hazards may result when untreated vessel wastes are discharged near shell fishing areas, bathing areas or public water supply intakes.

The Coast Guard enforces federal regulations established by the Environmental Protection Agency in waters of the United States, including territorial seas. Federal sanitary vessel waste treatment standards, however, are less stringent than New York’s standards. Present technological constraints for treating sanitary wastes, particularly on smaller recreational craft, make statewide enforcement of the State’s stricter effluent standards impractical. However, the prohibition of all vessel waste discharge is feasible on an area-specific basis, i.e., near shell fishing and bathing areas, and where adequate pumpout and treatment facilities are available. Federal law now prohibits discharges near public water supply intakes.

Dredging and Dredge Spoil Disposal

Dredging is a useful management tool serving a variety of purposes such as navigation channel maintenance, marina and shoreline development, beach nourishment, and pollutant removal. There is also substantial interest in the extensive offshore sand and gravel deposits in the State’s coastal waters, especially in the New York Bight. These are viewed as a future supply of materials for the construction industry in urban areas which now depends largely on decreasing local terrestrial supplies. Unfortunately,

many adverse environmental impacts have been associated with the processes of dredging and dredge spoil disposal, particularly when the sediments are polluted.

During dredging operations, sediments are re-suspended and mixed with water; this process thereby increases the potential for immediate release of contaminants into surrounding environments. After the dredge sediments are deposited at an open water disposal site, contaminants may be released slowly from the spoil mound into the overlying water column for several years. Because of this threat, the U.S. Environmental Protection Agency requires that polluted dredge spoils be “capped” with clean sediments.

Alternative dredge spoil disposal methods include upland disposal and placement behind diked enclosures. The shortage of suitable onshore disposal sites and the potential leaching of contaminants into adjacent ground and surface waters make these alternative methods expensive and environmentally unsafe. For example, New York State faces a difficult challenge in the safe removal and disposal of sediments that are contaminated with PCB’s from “hot spots” in the upper Hudson River.

Important adverse physical impacts on coastal waters may result from dredging and disposal activities. These include changes in bottom topography, local water circulation patterns, and flushing, erosion and sedimentation rates. Secondary biological effects, such as the loss of habitats, may result from the physical and chemical impacts identified above.

Environmental problems associated with dredging and spoil disposal can be minimized through careful selection of the disposal sites and timing of the dredging and spoil disposal operations. Such efforts, however, are thwarted by a lack of baseline data, e.g., location of important habitats, seasonal distribution of fish populations, local hydrologic conditions and sediment transport patterns.

Oil and Other Hazardous Substances Spills

The potential for oil and hazardous substances spills in New York’s coastal waters is high because of the substantial amount of commercial shipping. The possibility of such spills occurring in these waters is greater in major urban areas which have numerous oil and other bulk storage facilities. Nearly 1,000 oil and hazardous material spills were reported in New York State in 1976. In addition to spills, many bulk storage facilities also present air quality and fire hazard problems.

The potential development of offshore oil and gas resources along New York’s Atlantic shore and the onshore facilities essential to this activity increase the chances for spillage. The recent lifting of the ban on gas drilling beneath Lake Erie and the possibility of extending the Great Lakes navigation season increase the potential of the spillage of oil and hazardous substances in these coastal waters.

The cumulative effects of a series of small spills on water quality and other environmental degradation may be as great, or greater, than those caused by a single large spill. Consequently, a sophisticated surveillance and cleanup program is needed.

Adequate baseline data indicating the distribution patterns of important living aquatic resources is necessary in order to identify critical areas where spill incidents would cause serious biological damage. The data would assist in the proper siting of facilities and transportation routes and would be utilized in establishing cleanup priorities for New York Harbor and the Hudson and St. Lawrence Rivers and other vulnerable areas along New York’s coastline where there is intense shipping traffic.

Nutrients

High nutrient levels in coastal waters can stimulate excessive growth of rooted aquatic plants and algae blooms, and thus lower dissolved oxygen levels. These conditions disrupt water-oriented recreational activities such as swimming, boating and fishing.

In marine waters, nitrogen is usually the limiting nutrient to plant growth, while phosphorous is generally the limiting nutrient in fresh waters. While nutrients do not generally create a problem in open waters, recent episodes of anoxic conditions in the New York Bight indicate that the effects of nutrient overload have extended to the outer continental shelf. The effects of nutrients are most evident in bays and harbors of Long Island and the Great Lakes.

The accumulation of nitrates in groundwater can create a health problem, especially when an underground aquifer is the only source of drinking water. On Long Island, nitrate concentrations have, in some cases, approached maximum drinking water tolerance levels.

Nutrients are discharged into surface and groundwater from a variety of sources, including municipal treatment plants, urban stormwater, combined sewer overflows, malfunctioning septic systems, animal wastes, and agricultural runoff. For any given nutrient problem, and depending on the nature of sources in a tributary watershed, unique regulatory and structural measures may be required for its correction.

These may range from the sewers of shoreline cottages to application of special agricultural best management practices, or to nutrient removal at municipal treatment plants.

Groundwater

The relationship between land use activities occurring in the vicinity of ground water aquifer recharge areas and the water quality of the groundwater has become more apparent in recent years. For instance, excessive application of lawn fertilizers, failing septic systems and use of road salts for de-icing can cause elevated nitrate and chloride concentrations in groundwater. Where communities, such as those on Long Island, must rely on groundwater as their primary source of drinking water, serious health problems could result.

The challenge to Long Island communities is not only to protect the quality but also the quantity of their groundwater resources. In an effort to reduce the leaching of contaminants from failing cesspools and septic systems into the groundwater aquifer, several communities have installed public sewage treatment systems. Although this results in a net removal and treatment of pollutants, significant quantities of water which otherwise would have recharged the aquifer are instead treated and discharged into marine waters or their tributaries. This practice causes the volume of the freshwater aquifer to shrink, and the salt water intrusion from the surrounding sea to increase; a loss of potable groundwater results. Recharge basins have been built throughout Long Island to retain stormwater and allow it to filter into the groundwater aquifer.

When stormwater flows over roads, parking lots, industrial sites, and other areas, it picks up contaminants. It appears that treatment of the stormwater collected in the recharge basins may be necessary, since trace levels of toxic contaminants are now being detected in some of Long Island's groundwater aquifers.

Solid Wastes

As water pollution efforts lead to higher levels of municipal and industrial wastewater treatment, greater volumes of residual sludge will result. Because of their physical and chemical properties, there are no easy solutions for the disposal of most sludge. Traditional methods have included land disposal either in landfills or by spreading on land, incineration, and ocean dumping. Land disposal poses problems with odors, runoff

and leaching; incineration affects air quality conditions; and ocean dumping may have adverse effects upon water quality and aquatic life.

Water Quality Management Planning programs being carried out at both the State and regional levels under Section 201 and 208 of Federal Water Pollution Control Act of 1972 (PL 92-500) are currently studying the available alternatives for environmentally sound sludge management and disposal, as well as the disposition of certain other residual wastes. In addition, the Clean Water Act of 1977 (PL 95-217) calls for EPA to conduct a study on the utilization of treated municipal wastewater and sludge.

In New York State the most severe impacts from sludge disposal occur in the New York City metropolitan area. Open water dumping in the New York Bight adversely affected fishery resources. Discussions are ongoing as to whether or not any dumping will be allowed at the present site or at some other undetermined location in the Bight.

Solid wastes such as certain manufacturing wastes and residue from incinerators also pose substantial hazards to water quality, especially in the New York metropolitan area where suitable onshore disposal sites are limited. Even where these sites are available, the toxicity or hazardous nature of some solid wastes necessitates expensive treatment and disposal methods and long-term monitoring of land disposal sites.

Thermal Discharges

Most of New York State's electric generating facilities and certain other industrial activities are located along the coast because of the availability of large volumes of water needed for cooling purposes. The production of electric power results in large amounts of waste heat. Water used as a coolant is then discharged into water bodies. This discharge of warm water can create serious problems for the aquatic species and the quality of coastal water, especially if discharged intermittently as is customary with the startup and shut down of generating facilities.

Thermal discharges in small embayment or semi-enclosed areas (such as estuaries) are likely to have more negative effects on fish than discharges in open waters. These enclosed water bodies have low dilution capacities and flushing rates and thus cannot easily dissipate thermal discharges. These coastal waters, therefore, are less appropriate as locations for major stream electric generating facilities.

During winter months, fish often congregate in the warmer waters created by discharged water. However, should a generating facility be shut down for a period of time, the sudden drop in water temperature could cause thermal shock and subsequent death to large numbers of fish.

Also, warmer water contains less dissolved oxygen which is needed by a water body to neutralize certain wastes. By discharging heated water into a water body, its capacity to assimilate waste is reduced.

Water Supply

Generally, New York State is blessed with ample annual precipitation to recharge the State's reservoirs, lakes, rivers, and groundwater aquifers. But from 1979-81, particularly the winter and spring of 1981, precipitation levels declined and drought-related impacts and problems started to become evident. In December 1980, Governor Carey established the State Drought Management Task Force to coordinate New York State agency efforts to manage the intensifying drought in the State. This Task Force prepared the New York State Drought Preparedness Plan which provides a staged plan of action for local and State agencies in the event of a drought emergency.

Several short and long-range water supply projects were outlined in the Plan. While most of the water supply projects are proposed for inland water systems, one particular proposal to use the Hudson River to augment New York City's water supply is noteworthy. The Hudson River Flow Skimming Project would draw water from the river above the City of Poughkeepsie. This project poses a number of water quality and other environmental issues of concern to the State and coastal communities located along the Hudson which presently utilize the river as a water supply. A considerable effort will be needed to build broad-based support of this project before it can be implemented.

Precipitation levels increased to normal levels in the following fall and winter of 1981 through the present, and New York is not presently threatened by drought. However, the State has prepared itself in the event of a future drought by completing a strategy for coping with drought-related problems.

Other Water Resource Related Issues

Issues related to flooding, lake level management, and winter navigation are described under the Issue Section on Flooding and Erosion. Infrastructure related problems are addressed in the guidelines for implementing Policy 5 on Concentration of Development.

Data and information gathered in the numerous water resource studies such as the 303e Basin Studies, and the Level "B" Studies and the River Basin Studies, were used in developing the New York Coastal Atlas and in the preparation of the Coastal Management Regional Elements, published in 1979.

AIR QUALITY

Introduction

All of the State's coastal areas are affected by federal and State policies to abate and prevent air pollution. The Coastal Zone Management Act, as amended, reflects this, for any State air pollution control program requirements developed pursuant to the federal Clean Air Act must be incorporated into a State's Coastal Management Program.

The State's Air Pollution Control and Coastal Management Programs must be coordinated to ensure that each can be effectively utilized to support mutually desirable objectives. New York State's air pollution regulatory programs can be enlisted to achieve coastal management objectives such as protection of habitats, farmland, or scenic areas. At the same time, these programs could conflict with some coastal management objectives such as those related to economic development. Coordination requirements are essential to develop and implement an effective coastal management program.

Major air quality management concerns in the coastal area, as elsewhere, are grouped into four general categories: the attainment and maintenance of National Ambient Air Quality Standards as proposed in the State Implementation Plan; protection of clean air areas from significant deterioration; air pollution control problems in rural areas; and control of toxic discharges into the air.

Attainment and Maintenance of National Air Quality Standards

Under the federal Clean Air Act, National Ambient Air Quality Standards have been established for seven pollutants. Recent amendments to the Act (1977) require that the compliance status of all areas of the country be determined for five of the seven pollutants. The Act further requires that all areas not in compliance with these pollutant standards be brought into compliance by the end of 1982 or, in special

cases, by the end of 1987. The Act also requires states to prepare “State Implementation Plans” which detail the mechanisms that will be utilized to attain the standards by the statutory date.

Table 2 indicates the coastal areas designated for nonattainment of the health related National Ambient Air Quality Standards for various pollutants. With the exception of the New York Metropolitan Air Quality Control Region, where extensions to 1987 have been granted by the United States Environmental Protection Agency for ozone and carbon monoxide, the entire Coastal Area is expected to attain all health-related National Ambient Air Quality Standards by the end of 1982.

Table 2: Coastal Areas Designated as Nonattainment Areas for Health-Related Pollutants

COASTAL AREAS DESIGNATED AS NONATTAINMENT AREAS FOR HEALTH-RELATED POLLUTANTS

In coastal areas not meeting air quality standards, any new major source of air pollution must install air pollution controls, and existing sources must reduce their air pollution emissions. These reductions in emissions from existing sources are often difficult to obtain. Because of this, nonattainment areas are not as desirable for certain types of economic activities.

Maintenance of air quality standards is ensured through the review of the air quality impact of major new sources. Areas which have recently improved from the nonattainment to the attainment category will have little room for increased pollution emissions before violating air quality standards. Therefore, the air quality maintenance program may make it more difficult to locate certain types of activities in coastal areas which have just recently become attainment areas.

Protection of Clean Air Areas from Significant Deterioration

The 1977 amendments to the Clean Air Act require a State to protect “clean air areas” from significant deterioration through regulations that classify the entire State into one of three land area classifications based upon allowable deterioration of air quality. This program can be supportive of the overall coastal management environmental goal to preserve, protect, enhance, or restore natural resources. At the present time, all of New York State is classified “Class II” which allows for moderate increases in air pollution. After obtaining agreement from the affected local governments and the State Legislature, the Governor may re-designate areas as Class I, where minimal increases in air pollution are allowed, or Class III where substantial increases in air pollution are allowed. The difficulty in obtaining and coordinating all of the approvals and the fact that the quality of air in most coastal locations is too near the established standards to allow full utilization of the increment permissible under Class II indicate that there will be few, if any, re-designations to Class III. Similarly, it is unlikely that there will be any re-designations of areas of the State to Class I, since the State air pollution source review system, other State development review programs, and local land use regulations are more suitable for preserving undeveloped areas than the inflexible Prevention of Significant Deterioration program.

Air Pollution Control Problems in Rural Areas

Air quality conditions outside metropolitan areas are generally good, and concentration levels for most pollutants are below national standards. Throughout the State, however, pollutants which are carried long distances from where they are produced can adversely affect agriculture, fish, wildlife and water quality. These pollutants, such as ozone and the acid rain precursors, sulfates and nitrates, are generated by motor vehicles, refineries, chemical plants and power plants which are often hundreds of miles from the rural areas affected. New York State has embarked upon a comprehensive program of documenting the mechanisms and effects of acid rain while utilizing Section 126 of the Clean Air Act to attempt to force upwind states to limit their contributions to air pollution within New York State. Achieving coastal management policies for agriculture, fish, wildlife, and water quality will be, in part, dependent upon the State’s continuing effort to reduce air pollution from sources which affect the rural areas of the State’s coast.

Control of Toxic Discharges into the Air

Toxic discharges into the air, water and land are of major national and State concern. In some areas of New York, toxics have a significant adverse impact on the use of coastal resources for economic and recreational purposes. While the State has long regulated toxic emissions directly into the air from industrial facilities, toxic air pollution from old chemical dumps such as Love Canal, from the demolition of contaminated buildings and from facilities which detoxify waste products are presenting new challenges. Detoxification

facilities and the potential use of toxic wastes as fuel in some industrial processes may foster the economic development potential of the State's coastal area.

SECTION 6 – COASTAL POLICIES AND IMPLEMENTATION

The Coastal Management Program has a dual role. In one respect, it acts as an advocate for specific, desired coastal actions. In another respect it serves as a coordinator of existing State programs, activities, and decisions which affect the coastal area. The need for this double function became clear during the analysis of the State's coastal area. This analysis resulted in the identification of ten specific issues which were not then being adequately addressed by existing State law or regulations.

The first and most obvious problem was that government agencies, assigned disparate responsibilities and programs, were not required to coordinate, and as a result, decisions affecting the appropriate uses of the State's coastal resources were inconsistent. Obviously, there was a need to coordinate decision-making within and between each level of government with the passage of the Waterfront Revitalization of Coastal Areas and Inland Waterways law. Section 919 of that law provided the authority to solve this problem.

The nine other issues which required additional attention include: promoting waterfront revitalization; promoting water dependent uses; protecting fish and wildlife habitats; protecting and enhancing scenic areas; protecting and enhancing historic areas; protecting farmlands; protecting and enhancing small harbors; enhancing and protecting public access; providing solid and useful data and information on coastal resources and activities to decision makers and coping with erosion and flooding hazards. Each of these items necessitated a specific action. The last problem coping with erosion and flooding hazards required passage of the Coastal Erosion Hazard Areas law. The Waterfront Revitalization of Coastal Areas and Inland Waterways law gave the Coastal Management Program the authority to further advocate each of these activities. A more complete discussion of the Program's role in connection with these activities appears in Part II, Section 4 - Program Management.

COORDINATION

In the past, agencies usually pursued single purpose programs without considering their interrelationships or combined effect on the coastal area. The Coastal Management Program provides the basis for coordinating these programs, in part by spelling out the 44 policies discussed below. For the first time, all State agencies are required to advance these policies toward their logical conclusion, not allowing one policy to override another. More specifically, the use of this particular set of additional criteria as embodied in the 44 policies requires agencies to take into account the interrelationships that exist and/or should exist in the coastal area - not just interrelationships evident in a single ecosystem, i.e., wetlands, but the coastal area as a whole. This approach assures that future actions in the coastal area will, at a minimum, not interfere with the State's long term commitment to achieving for society the most beneficial use of coastal resources.

POLICIES

While the distinction can never be complete, for the most part, each of the 44 policy statements either promotes the beneficial use of coastal resources, prevents their impairment, or deals with major activities that substantially affect numerous resources. In all cases State agencies are required to adhere to each policy statement as much as is legally and physically possible.

The policies designed to promote the use of coastal resources are summarized as follows:

- revitalize underutilized waterfronts (Policy 1)

- facilitate water dependent uses (Policy 2)
- expand the State's major ports (Policy 3)
- expand the State's commercial fishing industry (Policy 10)
- expand public access and water related recreation (Policies 9, 19-22)
- develop coastal energy resources (Policy 27, 29)
- redevelop the existing built environment (Policies 1, 4, 5)
- expedite permitting procedures (Policy 6)

Use of all coastal resources is, however, constrained by the realization that to assure a reasonable quality of life for the long term, the coastal resources essential to society must be carefully husbanded. This frugal use necessitates strong protection measures for certain fragile or rapidly diminishing resources. These resources identified as being in need of protection are as follows:

- significant fish and wildlife habitats (Policies 7, 8)
- the traditional character and purposes of small harbors (Policy 4)
- historic and cultural resources (Policy 23)
- exceptional scenic areas (Policy 24)
- agricultural land (Policy 25)
- dunes, beaches, barrier islands and other natural protective features (Policy 12)
- water and air resources (Policies 31, 32, 33, 26-28, 40-43)
- wetlands (Policy 44)

Supplementing the above are a few policies which address major activities. These policies clearly state that in undertaking these activities, special care must be taken not to impair valued coastal resources.

- siting energy facilities (Policy 27)
- dredging for navigation, mining, and excavation in coastal waters (Policy 15)
- managing solid waste (Policy 39)
- ice management practices (Policy 28)
- siting and building structures in erosion hazard areas (Policies 11, 13, 14, 16, 17)
- adequate consideration of State and public interests for all major coastal activities (Policy 18)

The policies in this Section of the document constitute all the policies of the program and provide a source of information for all state agencies. All of the Program's policies are derived from existing laws and regulations administered by state agencies. Table 1 identifies the various laws that provide the basis for and are essential to the enforcement and implementation of the coastal policies. Many of the Program's policies are carried out by programs administered by the Department of Environmental Conservation. For example, the Department operates regulatory programs which provide protection to tidal and freshwater wetlands (Policy 44), restrict development and other activities in flood and erosion hazard areas (Policies 11-17), and

protect air and water resources (Policies 30-35 and 40-43). Other agencies, such as the Office of Parks, Recreation and Historic Preservation, Public Service Commission and the State Board on Electric Generation Siting and the Environment administer programs which provide coastal recreational facilities, regulate the siting of energy transmission facilities and regulate the location of electric power plants.

Other Program policies are based upon the provision of Article 42 of the Executive Law. These policies carry out the intention of the State Legislature that there be “a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing the loss of living marine resources and wildlife, diminution of open space areas or public access to the waterfront, shoreline erosion, impairment of scenic beauty, or permanent adverse changes to ecological systems” (Executive Law, §912(1)). Executive Law, Article 42, requires that actions directly undertaken by State agencies within the State’s Coastal Area be undertaken in a manner consistent with this new, second group of policies. In addition, the procedures of the State Environmental Quality Review Act (Environmental Conservation Law, Article 8) will insure that all State agency actions will be consistent with these policies.

It is important to note that no policy applies to the exclusion of the others. In applying these policies to a given action, all policies relevant to the action are to be adhered to. 19 NYCRR Part 600 and 6 NYCRR Part 617 dictate the only circumstances under which a policy need not be fully adhered to.

The following pages in this section contain an explicit statement of State policy, followed by a more detailed explanation of that statement. In many instances, the explanation is followed by guidelines to be used by agencies in their decision making.

POLICY 1

Restore, revitalize, and redevelop deteriorated and underutilized waterfront areas for commercial, industrial, cultural, recreational and other compatible uses.

A. Explanation of Policy

State and federal agencies must ensure that their actions further the revitalization of urban waterfront areas. The transfer and purchase of property; the construction of a new office building, highway or park; the provision of tax incentives to businesses; establishment of enterprise zones, are all examples of governmental means for spurring economic growth. When any such action or similar action is proposed, it must be analyzed to determine if the action would contribute to or adversely affect a waterfront revitalization effort.

It must be recognized that revitalization of once dynamic waterfront areas is one of the most effective means of encouraging economic growth in the State, without consuming valuable open space outside of these waterfront areas. Waterfront redevelopment is also one of the most effective means of rejuvenating or at least stabilizing residential and commercial districts adjacent to the redevelopment area.

In responding to this policy, several other policies must be considered: (1) Uses requiring a location abutting the waterfront must be given priority in any redevelopment effort. (Refer to Policy 2 for the means to effectuate this priority); (2) As explained in Policy 5, one reason for revitalizing previously dynamic waterfront areas is that the costs for providing basic services to such areas is frequently less than providing new services to areas not previously developed; (3) The likelihood

for successfully simplifying permit procedures and easing certain requirements (Policy 6) will be increased if a discrete area and not the entire urban waterfront is the focus for this effort. In turn, ease in obtaining permits should increase developers' interest to invest in these areas. Further, once this concentrated effort has succeeded, stabilization and revitalization of surrounding areas is more likely to occur.

Local governments through waterfront revitalization programs have the primary responsibility for implementing this policy. Though local waterfront revitalization programs need not be limited to redevelopment, local governments are urged to identify areas as suitable for redevelopment, and establish and enforce redevelopment programs.

1. When a federal or State action is proposed to take place in an urban waterfront area regarded as suitable for redevelopment, the following guidelines will be used:
 - a) Priority should be given to uses which are dependent on a location adjacent to the water;
 - b) The action should enhance existing and anticipated uses. For example, a new highway should be designed and constructed so as to serve the potential access needs for desirable industrial development;
 - c) The action should serve as a catalyst to private investment in the area;
 - d) The action should improve the deteriorated condition of a site and, at a minimum, must not cause further deterioration. For example, a building could not be abandoned without protecting it against vandalism and/or structural decline;
 - e) The action must lead to development which is compatible with the character of the area, with consideration given to scale, architectural style, density, and intensity of use;
 - f) The action should have the potential to improve the existing economic base of the community, and, at a minimum, must not jeopardize this base. For example, waterfront development meant to serve consumer needs would be inappropriate in an area where no increased consumer demands were expected and existing development was already meeting demand;
 - g) The action should improve adjacent and upland views of the water, and, at a minimum, must not affect these views in an insensitive manner;
 - h) The action should have the potential to improve the potential for multiple uses of the site.
2. If a State or federal action is proposed to take place outside of a given deteriorated, underutilized urban waterfront area suitable for redevelopment, and is either within the relevant community or adjacent coastal communities, the agency proposing the action must first determine if it is feasible to take the action within the deteriorated, underutilized urban waterfront area in question. If such an action is feasible, the agency should give strong consideration to taking the action in that area. If not feasible, the agency must take the appropriate steps to ensure that the action does not cause further deterioration of that area.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires (1) that State agencies' action, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for the restoration and revitalization of natural and human-made resources. This provision of law is implemented by amendments to SEQR (cf. 2. below) and by DOS regulations. DOS regulations (19 NYCRR 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Restore, revitalize, and redevelop deteriorated and underutilized waterfront areas for commercial, industrial, cultural, recreational and other compatible uses"; 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3) that SEQR regulations will be amended to reflect consideration of the need to restore and revitalize coastal resources.

Section 915 of the law requires local governments, if they choose to participate in the Waterfront Revitalization Program, to: identify uses, public and private to be accommodated in the waterfront area; describe means for long-term management and maintenance of waterfront development; and specify their authority and capability to implement the program. Further, as appropriate to the area, local programs must facilitate the location of industrial, commercial and other uses which benefit from a waterfront location.

During the preparation of a program, local governments will be required to analyze the entire coastal area to determine the most desirable activities. (See Section 8 for a more detailed description of local Waterfront Revitalization Programs). Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environment Conservation Law (Article 8)

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Restore, revitalize, and redevelop deteriorated and underutilized waterfront areas for commercial, industrial, cultural, recreational and other compatible uses".

3. Historic and Cultural Properties, Public Buildings Law (Article 4-B)

The Commissioner of General Services is required to consider the use and restoration of historic buildings in meeting the State's needs for building space.

4. New York State Urban Development Corporation Act (Chapter 174 of the Laws of 1968), Unconsolidated Laws

The Urban Development Corporation (UDC) created by this Act has the power to issue bonds and notes to obtain the capital resources necessary to carry out its powers to acquire,

construct, reconstruct, rehabilitate or improve industrial, manufacturing, commercial, educational, recreational, and cultural facilities as well as housing for low income persons and families in urban areas of the State. Where appropriate, and consistent with the other coastal policies, the power of UDC can be used to implement the intent of this policy.

5. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. Environmental Protection Act, Environmental Conservation Law (Article 54)
8. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)

This Act prohibits a state agency identified within the statute as a state infrastructure agency, including DOS, from approving, undertaking, supporting or financing a “public infrastructure project” unless the project is consistent with eleven (11) smart growth criteria to the extent practicable to evaluate a proposed public infrastructure project through the completion of a Smart Growth Impact Statement. The impact statement must address the compliance of the project with the Act’s listed smart growth criteria. The redevelopment of deteriorated and underutilized waterfront areas that includes public infrastructure projects will be required to meet the Smart Growth criteria prior to achieving approval from a State public infrastructure agency. If these projects require a federal permit, license or funding, then federal consistency review will include the satisfaction of the Act’s legal requirements for public infrastructure planning as part of the review process.

The smart growth public infrastructure criteria are:

- a. To advance projects for the use, maintenance or improvement of existing infrastructure;
- b. To advance projects located in municipal centers;
- c. To advance projects in developed areas or areas designated for concentrated infill development in a municipally approved comprehensive land use plan, local waterfront revitalization plan and/or brownfield opportunity area plan;
- d. To protect, preserve and enhance the state’s resources, including agricultural land, forests, surface and groundwater, air quality, recreation and open space, scenic areas, and significant historic and archeological resources;
- e. To foster mixed land uses and compact development, downtown revitalization, brownfield redevelopment, the enhancement of beauty in public spaces, the diversity and affordability of housing in proximity to places of employment, recreation and commercial development and the integration of all income and age groups;
- f. To provide mobility through transportation choices including improved public transportation and reduced automobile dependency;
- g. To coordinate between state and local government and intermunicipal and regional planning;

- h. To participate in community based planning and collaboration;
- i. To ensure predictability in building and land use codes; and
- j. To promote sustainability by strengthening existing and creating new communities which reduce greenhouse gas emissions and do not compromise the needs of future generations, by among other means encouraging broad based public involvement in developing and implementing a community plan and ensuring the governance structure is adequate to sustain its implementation. (§ 6-0107 (2))
- k. To mitigate future physical climate risk due to sea level rise, and/or storm surges and/or flooding, based on available data predicting the likelihood of future extreme weather events, including hazard risk analysis data if applicable.

10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)

The New York State Department of Environmental Conservation (NYSDEC) identifies and designates seagrass management areas in need of protection from certain boating and fishing activities and practices. The NYSDEC will develop management plans for each identified area to guide uses in the area to prevent any further damages to the seagrass beds. The identification of management areas provide for areas to be considered in the natural resource component of a consistency review.

11. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

The Act creates the New York Ocean and Great Lakes Ecosystem Conservation Council chaired by the New York State Department of Environmental Conservation and with the Department of State serving as executive director. Ecosystem-based management is to be integrated and coordinated with existing laws and programs. The Act manages human activities in a manner that sustains healthy, productive and resilient ecosystems, so any development, activities or uses must consider effects on interrelationships and resilient capacity of the entire system. All activities should foster healthy wildlife populations, and must do this in a way that considers the effects on interrelationships and sustainability.

12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

The Community Risk and Resiliency Act requires the consideration of climate change risks, including sea level rise, storm surges and flooding, in specified planning, permits, funding, regulatory programs and decision making, based on available data predicting the likelihood of future extreme weather events. This could affect decisions under the State Smart Growth Infrastructure Policy Act, Water Pollution and Drinking Water Revolving funds; some Environmental Protection Fund projects (including local waterfront revitalization programs, coastal rehabilitation projects, and open space and farmland protection), and some major permits issued pursuant to New York State's Uniform Procedures Act. The Community Risk and Resiliency Act also requires the Department of State, in consultation with the Department of Environmental Conservation to prepare model local laws addressing climate risk including sea level rise, storm surges and flooding, based on available data predicting the likelihood of future extreme weather

events, including hazard risk analysis data. Such model laws are to be made available to municipalities. The Act also requires the Department of State and the Department of Environmental Conservation to develop additional guidance on the use of resiliency measures that utilize natural resources and natural processes to reduce risk, and requires the Department of Environmental Conservation to adopt regulations establishing science-based state sea level rise projections.

POLICY 2

Facilitate the siting of water dependent uses and facilities on or adjacent to coastal waters.

A. Explanation of Policy

There is a finite amount of waterfront space suitable for development purposes. Consequently, while the demand for any given piece of property will fluctuate in response to varying economic and social conditions, on a statewide basis the only reasonable expectation is that long-term demand for waterfront space will intensify.

The traditional method of land allocation, i.e., the real estate market, with or without local land use controls, offers little assurance that uses which require waterfront sites will, in fact, have access to the State's coastal waters. To ensure that such "water dependent" uses can continue to be accommodated within the State, State agencies will avoid undertaking, funding, or approving non-water dependent uses when such uses would preempt the reasonably foreseeable development of water dependent uses; furthermore State agencies will utilize appropriate existing programs to encourage water dependent activities.

Water dependent activities shall not be considered a private nuisance, provided such activities were commenced prior to the surrounding activities and have not been determined to be the cause of conditions dangerous to life or health and any disturbance to enjoyment of land and water has not materially increased.

A water dependent use is an activity which can only be conducted on, in, over or adjacent to a water body because such activity requires direct access to that water body, and which involves, as an integral part of such activity, the use of the water. The following uses and facilities are considered as water dependent:

1. Uses which depend on the utilization of resources found in coastal waters (for example: fishing, mining of sand and gravel, mariculture activities);
2. Recreational activities which depend on access to coastal waters (for example: swimming, fishing, boating, wildlife viewing);
3. Uses involved in the sea/land transfer of goods (for example: docks, loading areas, pipelines, short-term storage facilities);
4. Structures needed for navigational purposes (for example: locks, dams, lighthouses);
5. Flood and erosion protection structures (for example: breakwaters, bulkheads);

6. Facilities needed to store and service boats and ships (for example: marinas, boat repair, and boat construction yards);
7. Uses requiring large quantities of water for processing and cooling purposes (for example: hydroelectric power plants, fish processing plants, pumped storage power plants);
8. Uses that rely heavily on the waterborne transportation of raw materials or products which are difficult to transport on land, thereby making it critical that a site near to shipping facilities be obtained (for example: fuel export facilities, cement plants, quarries);
9. Uses which operate under such severe time constraints that proximity to shipping facilities becomes critical (for example: firms processing perishable foods);
10. Scientific/educational activities which, by their nature, require access to coastal waters (for example: certain meteorological and oceanographic activities); and
11. Support facilities which are necessary for the successful functioning of permitted water dependent uses (for example: parking lots, snack bars, first aid stations, short-term storage facilities). Though these uses must be near the given water dependent use they should, as much as possible, be sited inland from the water dependent use rather than on the shore.

In addition to water dependent uses, those uses which are enhanced by a waterfront location should be encouraged to locate along the shore, though not at the expense of water dependent uses. A water-enhanced use is defined as a use or activity that does not require a location adjacent to or over coastal waters, but whose location on land adjacent to the shore adds to the public use and enjoyment of the water's edge. Water enhanced uses are primarily recreational, cultural, retail, or entertainment uses. A restaurant which uses good site design to take advantage of a waterfront views an example of a water-enhanced use.

If there is no immediate demand for a water dependent use in a given area but a future demand is reasonably foreseeable, temporary non-water dependent uses should be considered preferable to a non-water dependent use which involves an irreversible or nearly irreversible commitment of land. Parking lots, passive recreational facilities, outdoor storage areas, and non-permanent structures are uses of facilities which would likely be considered as "temporary" non-water dependent uses.

In the actual choice of sites where water dependent uses will be encouraged and facilitated, the following guidelines should be used.

1. Competition for space -- competition for space or the potential for it, should be indicated before any given site is promoted for water dependent uses. The intent is to match water dependent uses with suitable locations and thereby reduce any conflicts between competing uses that might arise. Not just any site suitable for development should be chosen as a water dependent use area. The choice of a site should be made with some meaningful impact on the real estate market anticipated. The anticipated impact could either be one of increased protection to existing water dependent activities or else the encouragement of water dependent development.
2. In-place facilities and services – most water dependent uses, if they are to function effectively, will require basic public facilities and services. In selecting appropriate areas for water dependent uses, consideration should be given to the following factors:

- a. The availability of public sewers, public water lines and adequate power supply;
 - b. Access to the area for trucks and rail, if heavy industry is to be accommodated; and
 - c. Access to public transportation, if a high number of person-trips is to be generated.
3. Access to navigational channels – if commercial shipping, commercial fishing, or recreational boating are planned, the locality should consider setting aside a site, within a sheltered harbor, from which access to adequately sized navigation channels would be assured.
 4. Compatibility with adjacent uses and the protection of other coastal resources - water dependent uses should be located so that they enhance, or at least do not detract from, the surrounding community. Consideration should also be given to such factors as the protection of nearby residential areas from odors, noise and traffic. Affirmative approaches should also be employed so that water dependent uses and adjacent uses can serve to complement one another. For example, a recreation-oriented water dependent use area could be sited in an area already oriented towards tourism. Clearly, a marina, fishing pier or swimming area would enhance, and in turn be enhanced by, nearby restaurants, motels and other non-water oriented tourist activities. Water dependent uses must also be sited so as to avoid adverse impacts on the significant coastal resources.
 5. Preference to underutilized sites - the promotion of water dependent uses should serve to foster development as a result of the capital programming, permit expediting, and other State and local actions that will be used to promote the site. Nowhere is such a stimulus needed more than in those portions of the State's waterfront areas which are currently underutilized.
 6. Providing for expansion - a primary objective of the policy is to create a process by which water dependent uses can be accommodated well into the future. State agencies and localities should therefore give consideration to long-term space needs and, where practicable, accommodate future demand by identifying more land than is needed in the near future.

In promoting water dependent uses the following kinds of actions should be considered:

1. Favored treatment to water dependent use areas with respect to capital programming. Particular priority should be given to the construction and maintenance of port facilities, roads, railroad facilities, and public transportation within areas suitable for water dependent uses.
2. When areas suitable for water dependent uses are publicly owned, favored leasing arrangements could be given to water dependent uses.
3. Where possible, consideration should be given to providing water dependent uses with property tax abatements, loan guarantees, or loans at below market rates.
4. State and local planning and economic development agencies should actively promote water dependent uses. In addition, a list of sites available for non-water dependent uses

should be maintained in order to assist developers seeking alternative sites for their proposed projects.

5. Local, State and federal agencies should work together to streamline permitting procedures that may be burdensome to water dependent uses. This effort should begin for specific uses in a particular area.
6. Local land use controls, especially the use of zoning districts exclusively for waterfront uses, can be an effective tool of local government in assuring adequate space for the development of water dependent uses.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this Act, one of which calls for the facilitation of the siting of water dependent uses and facilities. This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulation. Those DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is “Facilitate the siting of water dependent uses and facilities on or adjacent to coastal waters,” 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3) that SEQR regulations be amended to reflect consideration of coastal activities such as water dependent uses.

Section 2 of the law requires that State agencies analyze their program’s consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the legislature.

Section 915 of Article 42 provides for development of local waterfront revitalization programs (See Section 8 on Special Management Areas for a description of these programs.) A requirement of such local programs is that they must incorporate “the facilitation of appropriate industrial and commercial uses which require or can benefit substantially from a waterfront location, such as, but not limited to waterborne transportation facilities and services, and support facilities for commercial fishing and aquaculture.”

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is “Facilitate the siting of water dependent uses and facilities on or adjacent to coastal waters”.
3. New York State Urban Development Corporation Act (Chapter 174 of the Laws of 1968), Unconsolidated Laws

The Urban Development Corporation (UDC) created by this Act has the power to issue bonds and notes to obtain the capital resources necessary to carry out its power to acquire, construct, reconstruct, rehabilitate or improve industrial manufacturing, commercial, educational, recreational, and cultural facilities as well as housing for low income persons and families in urban areas of the State. Where appropriate, and consistent with other coastal policies, the powers of UDC can be used to implement this policy.

4. Capital Construction

The capital construction authority of various State agencies, particularly the Departments of Transportation and Environmental Conservation and the Offices of Parks, Recreation and Historic Preservation and General Services, can be used to provide the infrastructure or other amenities which would support or facilitate the development of water dependent uses along the shore.

5. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)

6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)

7. Environmental Protection Act, Environmental Conservation Law (Article 54)

8. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)

9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)

11. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)

12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 3

Further develop the State's major ports of Albany, Buffalo, New York, Ogdensburg and Oswego as centers of commerce and industry, and encourage the siting, in these port areas, including those under the jurisdiction of State public authorities, of land use and development which is essential to, or in support of, the waterborne transportation of cargo and people.

A. Explanation of Policy

The aim of this policy is to support port development in New York, Albany, Buffalo, Ogdensburg and Oswego. Three other development policies, discussed in this Section, have significant implications for port development, namely: water dependency, concentration of development, and the expediting of permit reviews. In implementing this policy, state agencies will recognize the legally-established jurisdictional boundaries of the port authorities. If an action is proposed for a site within or abutting a major port, or if there is a reasonable expectation that a proposed action elsewhere would have an impact on a major port, then the following guidelines shall be used in determining consistency:

1. In assessing proposed projects within or abutting a major port, given that all other applicable policies are adhered to, the overriding consideration is the maintenance and enhancement of port activity, i.e., development related to waterborne transportation, which will have precedence over other, non-port related activities.
2. Dredging to maintain the economic viability of major ports will be regarded as an action of regional or statewide public benefit if: a clear need is shown for maintaining or improving the established alignment, width, and depth of existing channels or for new channels essential to port activity; and, it can be demonstrated that environmental impacts would be acceptable level according to State regulations governing the activity.
3. Landfill projects in the near-shore areas will be regarded as an acceptable activity within major port areas, provided adverse environmental impacts are acceptable under all applicable environmental regulation and a strong economic justification is demonstrated.
4. If non-port related activities are proposed to be located in or near to a major port, these uses shall be sited so as not to interfere with normal port operations.
5. When not already restricted by existing laws or covenants, and when there is no other overriding regional or statewide public benefit for doing otherwise, surplus public land or facilities within or adjacent to a major port shall be offered for sale, in the first instance, to the appropriate port authority.
6. In the programming of capital projects for port areas, highest priority will be given to projects that promote the development and use of the port. However, in determining such priorities, consideration must also be given to non-port related interests within or near the ports that have demonstrated critical capital programming needs.
7. No buildings, piers, wharves, or vessels shall be abandoned or otherwise left unused by a public agency or sold without making provisions for their maintenance in sound condition or for their demolition or removal.
8. Proposals for the development of new major ports will be assessed in terms of the anticipated impact on: a) existing New York State major ports; b) existing modes of transportation; and c) the surrounding land uses and overall neighborhood character of the area in which the proposed port is to be located; and other valued coastal resources.
9. Port development shall provide opportunities for public access insofar as these opportunities do not interfere with the day-to-day operations of the port and the port authority and its tenants do not incur unreasonable costs.
10. In applying the above guidelines the information in harbor management plans being developed by local governments pursuant to Article 42 of the Executive Law and local laws that would implement them shall be considered.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: 1) that State agencies' actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this Act, one of which calls for encouraging the development and use of existing ports and reinforcing their role as valuable components within the State's transportation and industrial network. This provision of law is implemented by amendments to SEQR (See 2. below). DOS regulations (19 NYCRR Part 600.5) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Further develop the State's major ports of Albany, Buffalo, New York, Ogdensburg and Oswego as centers of commerce and industry and encourage the siting in these port areas, including those under the jurisdiction of state public authorities, of land use and development which is essential to or in support of the waterborne transportation of cargo and people". 2) that the Secretary of State may review actions of State agencies that may affect achievement of the policies; and 3) that SEQR regulations be amended to reflect consideration of coastal resources that can accommodate encouragement of development and use of major ports. Section 2 of the law requires that State agencies analyze their programs' consistency with Coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Further develop the State's major ports of Albany, Buffalo, New York, Ogdensburg and Oswego as centers of commerce and industry and encourage the siting in port areas, including those under the jurisdiction of state public authorities, of land use and development which is essential to or in support of the water-borne transportation of cargo and people."

3. General Functions, Powers and Duties of Department, Transportation Law (Article 2, Section 14) and Comprehensive Statewide Master Plan for Transportation, Transportation Law (Article 2, Section 15)

This law gives the New York State Department of Transportation overall responsibility for developing, coordinating, and carrying out comprehensive, balanced transportation policy and planning, to be expressed in a comprehensive statewide master plan for transportation. The Department also has responsibility to coordinate and assist in the balanced development and operation of transportation facilities and services, including marine facilities.

All proposed revisions to the comprehensive statewide master plan for transportation are to be reviewed by the Department of State, with any recommendations to be submitted to the Governor, who must approve such revisions.

4. Council of Upstate Ports

This Council, made up of representatives of the major upstate ports, acts to increase coordination among the ports and to increase cooperation between the ports and the State

(State agencies, particularly the Departments of Commerce and Transportation, regularly attend meetings).

5. New York State Urban Development Corporation Act (Chapter 174 of the Laws of 1968), Unconsolidated Laws

The Urban Development Corporation (UDC) created by this Act has the power to issue bonds and notes to obtain the capital resources necessary to carry out its powers to acquire, construct, reconstruct, rehabilitate or improve industrial, manufacturing, commercial, educational, recreational, and cultural facilities as well as housing for low income persons and families in urban areas of the State. Where appropriate and consistent with other coastal policies, the powers of UDC can be used to implement the intent of this policy.

6. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
7. Environmental Protection Act, Environmental Conservation Law (Article 54)
8. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
11. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 4

Strengthen the economic base of smaller harbor areas by encouraging the development and enhancement of those traditional uses and activities which have provided such areas with their unique maritime identity.

A. Explanation of Policy

This policy recognizes that the traditional activities occurring in and around numerous smaller harbors throughout the State's coastal area contribute much to the economic strength and attractiveness of these harbor communities. Thus, efforts of State agencies shall center on promoting such desirable activities as recreational and commercial fishing, ferry services, marinas, historic preservation, cultural pursuits, and other compatible activities which have made smaller harbor areas appealing as tourist destinations and as commercial and residential areas. Particular consideration will be given to the visual appeal and social benefits of smaller harbors which, in turn, can make significant contributions to the State's tourism industry.

The following guidelines shall be used in determining consistency:

1. The action shall give priority to those traditional and/or desired uses which are dependent on or enhanced by a location adjacent to the water.

2. The action will enhance or not detract from or adversely affect existing traditional and/or desired anticipated uses.
3. The action shall not be out of character with, nor lead to development which would be out of character with, existing development in terms of the area's scale, intensity of use, and architectural style.
4. The action must not cause a site to deteriorate, e.g., a structure shall not be abandoned without protecting it against vandalism and/or structural decline.
5. The action will not adversely affect the existing economic base of the community, e.g., waterfront development designed to promote residential development might be inappropriate in a harbor area where the economy is dependent upon tourism and commercial fishing.
6. The action will not detract from views of the water and smaller harbor area, particularly where the visual quality of the area is an important component of the area's appeal and identity.
7. In applying the above guidelines the information in harbor management plans being developed by local governments pursuant to Article 42 of the Executive Law and local laws that would implement them shall be considered.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: 1) that State agencies' actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this Act, one of which calls for efforts to encourage the development and use of smaller harbors. This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies one of which is: "Strengthen the economic base of smaller harbor areas by encouraging the development and enhancement of those traditional uses and activities which have provided such areas with their unique maritime identity"; 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3) that SEQR regulations be amended to reflect consideration of the need to use coastal resources.

Section 915 of the Article requires local governments if they choose to participate in the Waterfront Revitalization Program to: identify uses, public and private, to be accommodated in the waterfront area; to describe means for long term management and maintenance of waterfront development; and specify their authority and capability to implement the program. Further, as appropriate to the area, local programs must facilitate the location of industrial, commercial and other uses which benefit from a waterfront location. During the preparation of a program, local governments will be required to analyze the entire coastal area to determine the most appropriate activities which should

occur. Refer to Section 8 for a more detailed description of local Waterfront Revitalization Programs.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Strengthen the economic base of smaller harbor areas by encouraging the development and enhancement of those traditional uses and activities which have provided such areas with their unique maritime identity."

3. New York State Urban Development Corporation Act (Chapter 174 of the Laws of 1968), Unconsolidated Laws

The Urban Development Corporation (UDC) created by this Act has the power to issue bonds and notes to obtain the capital resources necessary to carry out its powers to acquire, construct, reconstruct, rehabilitate or improve industrial, manufacturing, commercial, educational, recreational, and cultural facilities as well as housing for low income persons and families in urban areas of the State. Where appropriate, and consistent with other coastal policies, the powers of UDC can be used to implement the intent of this policy.

4. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)

5. Environmental Protection Act, Environmental Conservation Law (Article 54)

6. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)

7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)

8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

9. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)

10. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)

11. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 5

Encourage the location of development in areas where public services and facilities essential to such development are adequate.

A. **Explanation of Policy**

By its construction, taxing, funding and regulatory powers, government has become a dominant force in shaping the course of development. Through these government actions, development,

particularly large-scale development, in the Coastal Area will be encouraged to locate within, contiguous to, or in close proximity to, existing areas of concentrated development where infrastructure and public services are adequate, where topography, geology, and other environmental conditions are suitable for and able to accommodate development.

The above policy is intended to accomplish the following:

- strengthen existing residential, industrial and commercial centers
- foster an orderly pattern of growth where outward expansion is occurring
- increase the productivity of existing public services and moderate the need to provide new public services in outlying areas
- preserve open space in sufficient amounts and where desirable
- foster energy conservation by encouraging proximity between home, work, and leisure activities.

For any action that would result in large scale development or an action which would facilitate or serve future development, a determination shall be made as to whether the action is within, contiguous to, or in close proximity to an area of concentrated development where infrastructure and public services are adequate. The following guidelines shall be used in making that determination.

1. Cities, built-up suburban towns and villages, and rural villages in the coastal area are generally areas of concentrated development where infrastructure and public services are adequate.
2. Other locations in the coastal area may also be suitable for development, if three or more of the following conditions prevail:
 - a. Population density of the area surrounding or adjacent to the proposed site exceeds 1,000 persons per square mile;
 - b. Fewer than 50% of the buildable sites (i.e., sites meeting lot area requirements under existing local zoning regulations) within one mile radius of the proposed site are vacant;
 - c. Proposed site is served by or is near to public or private sewer and water lines;
 - d. Public transportation service is available within one mile of the proposed site; and
 - e. A significant concentration of commercial and/or industrial activity is within one-half mile of the proposed site.
3. The following points shall be considered in assessing the adequacy of an area's infrastructure and public services:
 - a. Streets and highways serving the proposed site can safely accommodate the peak traffic generated by the proposed land development;
 - b. Development's water needs (consumptive and firefighting) can be met by the existing water supply system;

- c. Sewage disposal system can accommodate the wastes generated by the development;
- d. Energy needs of the proposed land development can be, accommodated by existing utility systems;
- e. Stormwater runoff from the proposed site can be accommodated by on-site and/or off-site facilities; and
- f. Schools, police and fire protection, and health and social services are adequate to meet the needs of the population expected to live, work, shop, or conduct business in the area as a result of the development.

It is recognized that certain forms of development may and/or should occur at locations which are not within or near areas of concentrated development. Thus, this coastal development policy does not apply to the following types of development projects and activities.

- 1. Economic activities which depend upon sites at or near locations where natural resources are present, e.g., lumber industry, quarries.
- 2. Development which by its nature is enhanced by a non-urbanized setting, e.g., a resort complex, campgrounds, second home developments.
- 3. Development which is designed to be a self-contained activity, e.g., a small college, an academic or religious retreat.
- 4. Water dependent uses with site requirements not compatible with this policy or when alternative sites are not available.
- 5. Development which because of its isolated location and small-scale has little or no potential to generate and/or encourage further land development.
- 6. Uses and/or activities which because of public safety consideration should be located away from populous areas.
- 7. Rehabilitation or restoration of existing structures and facilities.
- 8. Development projects which are essential to the construction and/or operation of the above uses and activities.

In certain urban areas where development is encouraged by this policy, the condition of existing public water and sewage infrastructure may necessitate improvements. Those State and federal agencies charged with allocating funds for investments in water and sewer facilities should give high priority to the needs of such urban areas so that full advantage may be taken of the rich array of their other infrastructure components in promoting waterfront revitalization.

B. State Means for Implementing the Policy

- 1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires: 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for the encouragement of concentration of development.

This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part GOO) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies one of which is: “Encourage the location of development in areas where public services and facilities essential to such development are adequate, except when such development has special functional requirements or other characteristics which necessitates its location in other coastal areas”; 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3) that SEQR regulations be amended to reflect consideration of the use and conservation of coastal resources.

Section 915 of the Article requires local governments to analyze their programs’ consistency with coastal policies and that the Secretary of State recommend any needed modifications to State programs.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant-impact upon the environment. The environment is broadly defined to include existing patterns of development, and land resources. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for State agency actions for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Encourage the location of development in areas where public services and facilities essential to such development are adequate, except when such development has special functional requirements or other characteristics which necessitates its location in other coastal areas”.

3. New York State Land Use Element⁵⁰

As approved by the Governor, the Land Use Element calls for a “concentrated pattern of development (that) would not only utilize existing services and facilities to their fullest capacity but would reduce growth pressures on valuable open lands and resources. Thus, both the economic vitality and environmental quality of the State would be improved”. The Land Use Element is used to guide the State’s funding and capital facilities decision-making processes.

4. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)

5. Environmental Protection Act, Environmental Conservation Law (Article 54)

6. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)

7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)

8. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)

9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
11. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 6

Expedite permit procedures in order to facilitate the siting of development activities at suitable locations.

A. Explanation of Policy

For specific types of development activities and in areas suitable for such development, State agencies and local governments participating in the Waterfront Revitalization Program will make every effort to coordinate and synchronize existing permit procedures and regulatory programs, as long as the integrity of the regulations' objectives is not jeopardized. These procedures and programs will be coordinated within each agency. Also, efforts will be made to ensure that each agency's procedures and programs are synchronized with other agencies' procedures at each level of government. Finally, regulatory programs and procedures will be coordinated and synchronized between levels of government, and if necessary, legislative and/or programmatic changes will be recommended.

When proposing new regulations, an agency will determine the feasibility of incorporating the regulations within existing procedures, if this reduces the burden on a particular type of development and will not jeopardize the integrity of the regulations' objectives.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 916 (2) of the law calls for the Office of Business Permits (OBP), with assistance from the Secretary of State, to determine means for expediting development called for in approved Waterfront Revitalization Programs, based on the consistency provisions of the Act. This activity of the OBP and Secretary of State is to include consolidating, simplifying, expediting or otherwise improving permit procedures.

Section 915 of the law requires local governments, if they choose to participate in the Waterfront Revitalization Program, to identify means for the long term management and maintenance of waterfront development including organizational structures, responsibilities and land use controls. To meet this requirement, a local government will have to, in part, determine if existing controls can be simplified in an effort to expedite desired development in areas suitable for such development. Further, the local government must identify those State and federal permit programs requiring simplification in order to expedite the desired development [Section 915 (5) (h)].

As explained in Section 8 of this document, a local program must be approved by its legislative body. This approval will require local regulatory agencies to adhere to the program policies, which, if the program is approved by the Secretary of State, will be adhered to by State and federal agencies. This adherence to one set of specific policies will

provide the basis for improving the ease of obtaining permits. This requirement, in conjunction with the requirement for all interests to be consulted during the program's preparation [915 (3)], lessens the time necessary for public review of individual actions when proposed, providing another means for expediting permits.

Section 916 (1) (b) of the law requires State agencies' actions to be consistent to the maximum extent practicable with approved local programs. As explained in Section VI of this document, local programs are, in part, a detailing of State policies. This detailing will significantly increase the specificity of State policies, decrease the discretionary power of the regulatory agency, increase the developer's understanding of approval conditions and provide a mechanism for expediting permits.

Section 2 of the law requires the Secretary of State to report to the Governor and Legislature additional means to further the purposes of the Act. Practical and efficient means for permit simplification will be a part of these recommendations.

2. Office of Business Permits, Executive Law (Article 39)

The Office of Business Permits "will provide comprehensive permit information, one-stop service for permit applicants, and the coordination of permit processing and review". [Section 875, Subdivision 3]

3. Uniform Procedures, Environmental Conservation Law (Article 70)

The law establishes uniform procedures and specific time periods for the processing of permits applications by the Department of Environmental Conservation.

4. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)

5. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

6. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)

7. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 7

Significant coastal fish and wildlife habitats will be protected, preserved, and, where practical, restored so as to maintain their viability as habitats.

A. Explanation of Policy

Habitat protection is recognized as fundamental to assuring the survival of fish and wildlife populations. Certain habitats are particularly critical to the maintenance of a given population and therefore merit special protection. Such habitats exhibit one or more of the following characteristics:

- (a) are essential to the survival of a large portion of a particular fish or wildlife population (e.g. feeding grounds, nursery areas);

- (b) support populations of rare and endangered species;
- (c) are found at a very low frequency within a coastal region;
- (d) support fish and wildlife populations having significant commercial and/or recreational value; and
- (e) would be difficult or impossible to replace.

In order to protect and preserve a significant habitat, land and water uses or development shall not be undertaken if such actions destroy or significantly impair the viability of an area as a habitat. When the action significantly reduces a vital resource (e.g., food, shelter, living space) or changes environmental conditions (e.g., temperature, substrate, salinity) beyond the tolerance range of an organism, then the action would be considered to “significantly impair the habitat. Indicators of a significantly impaired habitat may include: reduced carrying capacity, changes in community structure (food chain relationships, species diversity), reduced productivity and/or increased incidence of disease and mortality.

The range of generic activities most likely to affect significant coastal fish and wildlife habitats include but are not limited to the following:

1. Draining wetlands, ponds: Cause changes in vegetation, or changes in groundwater and surface water hydrology.
2. Filling wetlands, shallow areas of streams, lakes, bays, estuaries: May change physical character of substrate (e.g., sandy to muddy, or smother vegetation, alter surface water hydrology).
3. Grading land: Results in vegetation removal, increased surface runoff, or increase soil erosion and downstream sedimentation.
4. Clear cutting: May cause loss of vegetative cover, increase fluctuations in amount of surface runoff, or increase streambed scouring, soil erosion, sediment deposition.
5. Dredging or excavation: May cause change in substrate composition, possible release of contaminants otherwise stored in sediments, removal of aquatic vegetation, or change circulation patterns and sediment transport mechanisms.
6. Dredge spoil disposal: May induce shoaling of littoral areas, or change circulation patterns.
7. Physical alteration of shore areas through channelization or construction of shore structure: May change in volume and rate of flow or increased scouring, sedimentation.
8. Introduction, storage or disposal of pollutants such as chemical, petrochemical, solid wastes, nuclear wastes, toxic material, pesticide, sewage effluent, urban and rural runoff, leachate of hazardous and toxic substances stored in landfills: May cause increased mortality or sublethal effects on organisms, alter their reproductive capabilities, or reduce their value as food organisms.

The range of physical, biological and chemical parameters which should be considered include but are not limited to the following:

1. Physical parameters such as: Living space, circulation, flushing rates, tidal amplitude, turbidity, water temperature, depth (loss of littoral zone), morphology, substrate type, vegetation, structure, erosion and sedimentation rates.
2. Biological parameters such as: Community structure, food chain relationships, species diversity, predator/prey relationships, population size, mortality rates, reproductive rates, behavioral patterns, and migratory patterns.
3. Chemical parameters such as: Dissolved oxygen, carbon dioxide, pH, dissolved solids, nutrients, organics, salinity, pollutants (heavy metals, toxic and hazardous materials).

When a proposed action is likely to alter any of the biological, physical or chemical parameters as described in the narrative beyond the tolerance range of the organisms occupying the habitat, the viability of that habitat has been significantly impaired or destroyed. Such action, therefore, would be inconsistent with the above policy.

In cooperation with the State's Coastal Management Program, the Department of Environmental Conservation has developed a rating system incorporating these five parameters (*The Development and Evaluation of a System for Rating Fish and Wildlife Habitats in the Coastal Zone of New York State* Final Report, January, 1981, 15 pp.).

To further aid federal and State agencies in determining the consistency of a proposed action with this policy, a narrative will be prepared for each significant habitat which will: (1) identify the location of the habitat; (2) describe the community of organisms which utilize the habitat; (3) identify the biological, physical and chemical parameters which should be considered when assessing the potential impacts of a project on that habitat; (4) identify generic activities which would most likely create significant impacts on the habitat; and (5) provide the quantities basis used to rate the habitat. Prior to formal designation of significant fish and wildlife habitats, copies of the individual habitat narratives plus copies of habitat maps and completed rating forms will be provided to federal and State agencies and the public for the review and comment.

B. State Means for Policy Implementation

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires actions directly undertaken by the State agencies within the coastal area be consistent with coastal area policies including the policy calling for the protection of significant habitats. When a State agency provides funding assistance, develops a plan, sells, leases, transfers or buys land, or directly uses or develops land within the coastal boundaries, it must find that its action will not adversely affect any significant habitat within or near the proposed project area.

This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with coastal policies, one of which is: "Significant coastal fish and wildlife habitats, as identified on the Coastal Area Map, shall be protected and preserved so as to maintain their viability as habitats." The Secretary of State can review actions of

State agencies that may affect achievement of the policy. SEQR regulations have been amended to reflect consideration of significant coastal fish and wildlife habitats.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that is likely to have a significant impact upon the environment. Actions consistent with social, economic, and other essential considerations, which have been subject to an environmental impact statement must minimize or avoid to the maximum extent practicable, the adverse environmental effects revealed in the impact statement.

In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Significant coastal fish and wildlife habitats, as identified on the Coastal Area Map, shall be protected and preserved so as to maintain their viability as habitats."

3. Tidal Wetlands Act, Environmental Conservation Law (Article 24)

Of the 3,107 total miles of New York coastal shorelines, about, 1,600 miles are subject to regulation under the Program. Tidal wetlands often provide wildlife habitats which include breeding, nesting, feeding grounds, and vegetative cover for many types of wildlife, waterfowl and shorebirds. Approximately two-thirds of New York's marine sport and commercial finfish and shellfish species utilize tidal wetlands at some stage of their life cycle. Under this permit program the State regulates any land use activities that would diminish the value of wetlands as fish and wildlife habitats.

Regulated activities include any form of draining, dredging, excavation, dumping, filling, construction, pollutant discharge or any other activity which directly or indirectly impairs the tidal wetlands ability to provide habitat. The Department of Environmental Conservation has inventoried, classified and mapped the State's tidal wetlands.

4. Freshwater Wetland Act, Environmental Conservation Law (Article 24)

Freshwater wetlands also function as important fish and wildlife habitat. The program established under this Act regulates activities such as draining, dredging, and filling, thus protecting many significant habitats. This program can be administered by local governments pursuant to State guidelines and after official filing of wetland maps by the State. Counties, or the State, may administer the program in municipalities where local governments fail to exercise this responsibility. Until the maps are filed with the communities, the Department of Environmental Conservation regulates freshwater wetlands through its interim permit program. Before granting or denying a permit, the municipality must determine if the activity will have an adverse impact on the habitat value of the wetland.

5. Protection of Water, Environmental Conservation Law (Article 15, Title 5)

This law was enacted to minimize disturbances to the beds and banks of certain streams (Class C (t) and above) which cause increased turbidity, and irregular variations in velocity, temperature and water levels, in order to protect fish and wildlife and their habitats. The Department of Environmental Conservation regulates dredging and filling in navigable waters and adjacent wetlands, and construction of certain dams and docks. Further, it requires the removal, replacement or repair of illegal or unsafe structures, fills or excavations. This could accomplish restoration of physically altered habitats.
6. Wild, Scenic and Recreational Rivers System, Environmental Conservation Law (Article 15, Title 27)

Along stretches of rivers designated as “wild”, “scenic”, or “recreational”, the State Department of Environmental Conservation is authorized by this law to exercise land use controls in order to protect the outstanding natural, scenic, historic, ecological and recreational resources of these rivers. This may include the protection of fish and wildlife resources and their habitats in the preparation and implementation of adopted management programs.

Presently, portions of the Connetquot and Carmens Rivers in Suffolk County have been designated as scenic and recreational rivers. Studies are underway in other coastal areas of the State to determine which additional rivers should be included in this system.
7. Fish and Wildlife Management Practices Cooperative Program, Environmental Conservation Law (Article 11, Title 5, Section 0501)

This law enables the Department of Environmental Conservation to enter into cooperative agreements with private property owners to manage fish and wildlife resources and their habitats on privately owned lands.
8. New York State Park Preserve System, Parks and Recreation Law (Article 20)

This legislation gives the Office of Parks, Recreation, and Historic Preservation the power (in conjunction with Section 3.09 of Parks and Recreation Law, authorizing acquisition of land for State recreational facilities) to purchase park preserve areas in or near metropolitan regions in order to “maintain the integrity of fauna...” and to “provide for the management of all unique, rare, or endangered species of fauna within park preserves areas.” By purchasing fish and wildlife habitat areas for passive recreational uses, their preservation and management is assured. Assistance in identifying such areas can be provided to the Office of Parks, Recreation, and Historic Preservation through the Coastal Management Program.
9. State Nature and Historical Preserve Trust, Environmental Conservation Law (Article 45)

This section of Environmental Conservation Law authorizes the Department of Environmental Conservation, after recommendation by the State Nature and Historical Preserve Trust Board of Trustees and authorization by the State Legislature, to purchase property for inclusion. Lands that can be a part of the preserve include those of ecological significance, including coastal fish and wildlife habitats.

10. Implementation of Environmental Quality Bond Act of 1972, Environmental Conservation Law (Article 51)
Title 7 of Article 51 directs the Department of Environmental Conservation to appropriate monies from the Environmental Quality Bond Act for land preservation and improvement projects. These projects include acquisition of important tidal and freshwater wetlands. Acquisition of Real Property by Purchase or Appropriation, Environmental Conservation Law (Article 3, Title 3, Section 0305) gives the Department of Environmental Conservation the power to acquire property for any of the functions of the Department.
11. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
12. Environmental Protection Act, Environmental Conservation Law (Article 54)
13. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
14. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
15. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
16. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 8

Protect fish and wildlife resources in the coastal area from the introduction of hazardous wastes and other pollutants which bioaccumulate in the food chain or which cause significant sublethal or lethal effect on those resources.

A. Explanation of Policy

Hazardous wastes are unwanted byproducts of manufacturing processes and are generally characterized as being flammable, corrosive, reactive, or toxic. More specifically, waste is defined in Environmental Conservation Law [§27-0901(3)] as “waste or combination of wastes which because of its quantity, concentration, or physical, chemical or infectious characteristics may: (1) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness; or (2) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported or otherwise managed.” A list of hazardous wastes (NYCRR Part 366) will be adopted by DEC within 6 months after EPA formally adopts its list.

The handling (storage, transport, treatment and disposal) of the materials included on this list is being strictly regulated in New York State to prevent their entry or introduction into the environment, particularly into the State’s air, land and waters. Such controls should effectively minimize possible contamination of and bio-accumulation in the State’s coastal fish and wildlife resources at levels that cause mortality or create physiological and behavioral disorders.

Other pollutants are those conventional wastes, generated from point and non-point sources, and not identified as hazardous wastes but controlled through other State laws cited below.

B. State Means for Implementing the Policy

1. Industrial Hazardous Waste Management, Environmental Conservation Law (Article 27, Title 9)

The purpose of this State law is to authorize the NYS Department of Environment Conservation (DEC) to regulate the handling of hazardous wastes generation, storage, transportation, treatment and disposal in a manner consistent with the federal Resource Conservation and Recovery Act of 1976 (RCRA).

This State law mandates DEC to identify and list hazardous wastes, to develop and implement a manifest system for tracking the wastes “from cradle to grave”, and to regulate all phases of handling hazardous wastes. Strict enforcement of this law by DEC will minimize new introductions of hazardous wastes into the environment, thereby protecting Coastal fish and wildlife resources.

2. State Pollutant Discharge Elimination System, Environmental Conservation Law (Article 17, Title 8)

The Department of Environmental Conservation regulates all industrial, commercial and municipal discharges as well as those from residential subdivisions of five or more lots, into the State’s surface and groundwater. Through this program, the State can control the discharge of toxics and other pollutants from point sources which contaminate fish and wildlife resources.

3. State Certification, Federal Water Pollution Control Act (Section 401)

This section of the Federal Water Pollution Control Act Amendments of 1972 provides the State with authority to review applications for licenses or permits submitted to any federal agencies to conduct activities within the State and to certify whether discharges into the State’s navigable waters are in compliance with water quality requirements stipulated under various sections of the Federal Water Pollution Control Act and its amendments. Federal permits covered by this section are primarily those issued by the Army Corps of Engineers for dredging and dredged material disposal, by the Environmental Protection Agency for certain waste water discharges, and by the Nuclear Regulatory Commission and Federal Energy Regulatory Commission for nuclear and hydroelectric energy generating facilities. The discharge of pollutants resulting from such federal projects, which may affect the State’s coastal fish and wildlife resources, can be regulated accordingly.

4. Toxic Substance Monitoring Program, Environmental Conservation Law (Article 17)

This program is designed to monitor the occurrence and significance of 17 different toxicants in fish from 102 sampling locations statewide over a three-year period. This effort will enable the State to trace the distribution of toxic substances once they are discharged into the environment, identify those biological resources being affected, and direct clean-up operations accordingly.

5. Substances Hazardous or Acutely Hazardous to Public Health, Safety or the Environment, Environmental Conservation Law (Article 37)
Substances which are hazardous and tend to accumulate in the food chain threaten fish and wildlife and other living coastal resources. The State recently passed this law in an effort to control the discharge of hazardous substances into the environment. Rules and regulations pertaining to the storage and discharge of these substances are under preparation. The hazardous substances identified will be included within these rules and regulations.
6. Solid Waste Management and Resource Recovery Facilities, Environmental Conservation Law (Article 27, Title 7)
Garbage, refuse, industrial and commercial wastes, incinerator residue, sludge and other solid wastes can cause physiological disorders in fish and wildlife and contaminate their habitats if not treated and disposed of properly. The construction and operation of solid waste management facilities are regulated as authorized by this law, and such regulations are directed at the prevention or reduction of pollution of resources.
7. Polluting Streams Prohibited, Environmental Conservation Law (Article 11, Title 5, Section 0503)
Deleterious or poisonous substances (e.g., dyestuffs, coal tar, and refuse from a gas house) may not be discharged into any waters either private or public, in quantities injurious to fish life, protected wildlife or waterfowl inhabiting those waters or injurious to the propagation of fish, protected wildlife or waterfowl. Also, vessel wastes (oil, sludge, cinders, or ashes) may not be discharged into the Hudson River.
8. Protection of Waters; Cesspools and Drains, Environmental Conservation Law (Article 13, Title 3, Section 0345) and Prohibition Against Pollution of Waters of Marine District, Environmental Conservation Law (Article 17, Title 5, Section 0503)
These sections of the law provide for the protection of shellfish and fin fish from contaminants (e.g., sludge, acid, refuse, and sewage) which affect the flavor, odor, color, or sanitary condition of these fishery resources.
9. Oil Spill Prevention, Control and Compensation, Navigation Law (Article 12)
Unregulated discharge of petroleum or oil spills associated with the transport and storage of such products can damage the State's coastal fish, shellfish, wildlife and other biotic resources. This law authorizes the Department of Transportation and the Department of Environmental Conservation to control the methods of petroleum storage and transfer and to require prompt cleanup and compensation to damaged parties when spills or discharges occur.
10. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
Article 10 for the siting of new facilities replaces Public Service Law Article X, which expired on January 1, 2003, but is still valid for facilities licensed pursuant to it. Article 10 captures the review of the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. Siting review of new and repowered or modified major electric generating facilities in New

York State is by the Board on Electric Generation Siting and the Environment (Siting Board) using a unified proceeding instead of requiring numerous state and local permits. The law requires environmental and public health impact analyses, studies regarding environmental justice and public safety, and consideration of local laws. Article 10 also requires a utility security plan reviewed by Homeland Security.

11. Sanitary Code, Public Health Law (Article 3)
Municipalities are authorized by this law to adopt a Local Sanitary Code. These sanitary codes are designed to insure that individual sewage disposal systems do not create health hazards, do not adversely affect the environment, or do not impair the use of property. Obviously, fish and wildlife habitats can be protected from pollutants through the local adoption of such a sanitary code.
12. Environmental Protection Act, Environmental Conservation Law (Article 54)
13. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
14. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
15. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
16. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
18. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

These regulations provide the guidance and substantive requirements for the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. The regulations establish procedures and requirements for assuring that the applicant will comply with the terms, conditions, limitations, or modifications of the construction and operation of the facility authorized in the certificate. These regulations establish procedures for applications for certificates, requiring applicants to: actively seek public participation throughout the planning, pre-application, certification, compliance, and implementation process; demonstrate consistency with state energy planning objectives; submit a preliminary scoping statement; obtain a water quality certification; and secure a coastal consistency determination. The regulations also establish procedures affecting the construction or operation of major electric generating facilities pursuant to former Public Service Law Article VIII and Article X, so that the provisions will be applied in a manner that is consistent with former Article VIII of the Public Service Law remaining operative and continuing in full force and effect with regard to applications filed on or before December 31, 1978, and former Article X of the Public Service Law remaining operative and continuing in full force. Notwithstanding the Public Service Commission's authority to conduct the proceedings for the siting of the generating facilities, the Department of State retains its federal consistency review authority separate and apart from this process.

19. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6, Chapter IV, Subchapter H, Part 487)

POLICY 9

Expand recreational use of fish and wildlife resources in coastal areas by increasing access to existing resources, supplementing existing stocks, and developing new resources.

A. Explanation of Policy

Recreational uses of coastal fish and wildlife resources include consumptive uses such as fishing and hunting, and non-consumptive uses such as wildlife photography, bird watching and nature study.

Any efforts to increase recreational use of these resources will be made in a manner which ensures the protection of fish and wildlife resources in marine and freshwater coastal areas and which takes into consideration other activities dependent on these resources. Also, such efforts must be done in accordance with existing State law and in keeping with sound resource management considerations. Such considerations include biology of the species, carrying capacity of the resource, public demand, costs and available technology.

The following additional guidelines should be considered by State and federal agencies as they determine the consistency of their proposed action with the above policy.

1. Consideration should be made by federal and State agencies as to whether an action will impede existing or future utilization of the State's recreational fish and wildlife resources.
2. Efforts to increase access to recreational fish and wildlife resources should not lead to overutilization of that resource or cause impairment of the habitat. Sometimes such impairment can be more subtle than actual physical damage to the habitat. For example, increased human presence can deter animals from using the habitat area.
3. The impacts of increasing access to recreational fish and wildlife resources should be determined on a case-by-case basis, consulting the significant habitat narrative (see Policy 7) and/or conferring with a trained fish and wildlife biologist.
4. Any public or private sector initiatives to supplement existing stocks (e.g. stocking a stream with fish reared in a hatchery) or develop new resources (e.g. creating private fee-hunting or fee-fishing facilities) must be done in accord with existing State law.

B. State Means for Implementing the Policy

1. General Powers and Duties of the Department of Environmental Conservation, Environmental Conservation Law (Article 11, Title 3)

The Department of Environmental Conservation manages the State's fish and wildlife resources. It propagates fish and wildlife to supplement existing stocks; regulates their harvest through restricted seasons, bag limits, and gear restrictions, and develops new or improve existing habitats with such devices as stream improvement structures.

2. Stream Rights Acquisition, Environmental Conservation Law (Article 51, Title 7, Section 0701, Subsection 4)

This law enables the Department of Environmental Conservation to acquire access rights (fee-simple or less-than-fee-simple) on quality streams guaranteeing fishermen access to various stretches of streams and rivers. Additional information needed for determining priorities in this acquisition program will be provided to the Department of Environmental Conservation through the Coastal Management Program.

3. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919, of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this Act, one of which calls the promotion of the recreational use of fish and wildlife resources. This provision of law is, implemented by amendments to SEQR (cf. 2 below) and by DOS regulations.

DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the following policy: “Expand recreational use of fish and wildlife resources in coastal areas by increasing access to existing resources, supplementing existing stocks and developing new resources.” Such efforts shall be made in a manner which ensures the protection of renewable fish and wildlife resources and considers other activities dependent on them.

Section 2 of the law requires that State agencies analyze their programs’ consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

Section 915 of this law provides for funding of local government waterfront revitalization plans by the Department of State. Increased access to coastal waters for the purposes of fishing is strongly encouraged as one of the management objectives for a local waterfront revitalization plan.

4. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is:

“Expand recreational use of fish and wildlife resources in coastal areas by increasing access to existing resources, supplementing existing stocks and developing new resources. Such efforts shall be made in a manner which ensures the protection of renewable fish and wildlife resources and considers other activities dependent on them.”

5. General Functions, Powers and Duties, Parks and Recreation Law (Title B, Article 3, Section 3.09)

This law authorizes the Office of Parks, Recreation, and Historic Preservation to acquire, establish, and operate facilities for recreational purposes, including valuable fishing and on areas. For further information on the Office of Parks, Recreation, and Historic Preservation's powers, see the recreation policies contained in this report.

6. Urban Fisheries Program, Environmental Conservation Law (Article 11)
The Department of Environmental Conservation has elected to increase fishing activity in several metropolitan areas of the State, including Buffalo, Albany, Troy, and New York City, through its Urban Fisheries Program. Public education, eliminating problems of access to existing, under-utilized fisheries, and creation of new fisheries through stocking of ponds or establishing suitable habitat are specific means by which the objectives of this program will be accomplished. In most cases, these fishing areas are accessible by public transportation. However, in some instances, inadequate mass transportation constrains public use of these resources.
7. Urban Wildlife Program, Environmental Conservation Law (Article 11)
8. Fish and Wildlife Management Practices Cooperative Program, Environmental Conservation Law (Article 11, Title 5, Section 0501)
9. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
10. Environmental Protection Act, Environmental Conservation Law (Article 54)
11. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
12. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
13. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
14. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
15. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
16. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 10

Further develop commercial finfish, shellfish and crustacean resources in the coastal area by encouraging the construction of new, or improvement of existing on-shore commercial fishing facilities, increasing marketing of the State's seafood products, maintaining adequate stocks, and expanding aquaculture facilities.

A. Explanation of Policy

Commercial fishery development activities must occur within the context of sound fishery management principals developed and enforced within the State's waters by the New York State Department of Environmental Conservation and the Management plans developed by the Regional

Fisheries Management Councils (Mid-Atlantic and New England) and enforced by the U.S. National Marine Fisheries Service within the Fishery Conservation Zone. (The Fishery Conservation Zone is the area of coastal waters extending from the three mile State waters boundary to the 200 mile offshore boundary of U.S. waters. The Conservation Zone is authorized by the U.S. Fishery Conservation and Management Act of 1976.) Sound resource management considerations would include optimum sustained yield levels developed for specific commercial fish species, harvest restrictions imposed by State and federal governments, and the economic, political (uses conflicts) and technological constraints to utilizing these resources.

The following additional guidelines should be considered by State and federal agencies as they determine the consistency of their proposed action with the above policy:

- a. A public agency's commercial fishing development initiative should not preempt or displace private sector initiative.
- b. A public agency's efforts to expand existing, or create new on-shore commercial fishing support facilities should be directed towards unmet development needs rather than merely displacing existing commercial fishing activities from a nearby port. This may be accomplished by taking into consideration existing State or regional commercial fishing development plans.
- c. Consideration should be made by State and federal agencies whether an action will impede existing utilization or future development of the state's commercial fishing resources.
- d. Commercial fishing development efforts should be made in a manner which ensures the maintenance and protection of the renewable fishery resources.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 915 of this law authorizes the Department of State to encourage municipalities which choose to develop local waterfront revitalization programs to implement commercial fishing port development projects. Such facilities might include the construction or rehabilitation of piers; facilities for catch transfer, freezer storage, fishing processing and packaging; or aquaculture facilities.

Section 919, of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which is: Further develop commercial finfish, shellfish and crustacean resources in the coastal area by encouraging the construction of new, or improvement of existing on-shore commercial fishing facilities, increasing marketing of the State's seafood products, maintaining adequate stocks, and expanding aquaculture facilities. This provision of law is implemented by amendments to SEQR (of 2 below) and by DOS regulations.

DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the following policy: "Further develop commercial finfish, shell-fish and

crustacean resources in the coastal area by: (i) encouraging the construction of new or improvement of existing on-shore commercial fishing facilities; (ii) increasing marketing of the State's seafood products; (iii) maintaining adequate stocks and (iv) expanding aquaculture facilities. Such efforts shall be made in a manner which insures the protection of such renewable fish resources and considers other activities dependent on them.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Environmental impact as defined in this law includes not only impact on the State's natural resources but also the State's economy.

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is:

“Further develop commercial finfish, shellfish and crustacean resources in the coastal area by: (i) encouraging the construction of new or improvement of existing on-shore commercial fishing facilities; (ii) increasing marketing of New York seafood products; (iii) maintaining adequate stocks and (iv) expanding aquaculture facilities. Such efforts shall be made in a manner which ensures the protection of such renewable fish resources and considers other activities dependent on them.”

3. Environmental Protection Act, Environmental Conservation Law (Article 54)
4. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 11

Buildings and other structures will be sited in the coastal area so as to minimize damage to property and the endangering of human lives caused by flooding and erosion.

A. Explanation of Policy

On coastal lands identified as coastal erosion hazard areas, buildings and similar structures shall be set back from the shoreline a distance sufficient to minimize damage from erosion unless no reasonable prudent alternative site is available as in the case of piers, docks and other structures necessary to gain access to coastal waters to be able to function. The extent of the setback will be

calculated, taking into account the rate at which land is receding due to erosion and the protection provided by existing erosion protection structures as well as by natural protective features such as beaches, sandbars, spits, shoals, barrier islands, bay barriers, nearshore areas, bluffs and wetlands. The only new structure allowed in coastal erosion hazard areas is a moveable structure as defined in 6NYCRR Part 505.2(x). Prior to its construction, an erosion hazard areas permit must be approved for the structure. Existing, non-conforming structures located in coastal erosion hazard areas may be only minimally enlarged.

In coastal lands identified as being subject to high velocity waters caused by hurricane or other storm wave wash - a coastal high hazard area - walled and roofed buildings or fuel storage tanks shall be sited landward of mean high tide, and no mobile home shall be sited in such area. In coastal lands identified as floodways, no mobile homes shall be sited other than in existing mobile home parks.

Where human lives may be endangered by major coastal storms, all necessary emergency preparedness measures should be taken, including disaster preparedness-planning.

B. State Means for Implementing the Policy

1. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
This law provides for the identification of coastal erosion hazard areas, including natural protective features such as beaches and dunes. The law also requires the calculation of rates of recession of coastal lands. Standards and criteria are also prescribed for the regulation of the siting of buildings and other structures in relation to those defined areas.
2. Flood Plain Management Act, Environmental Conservation Law (Article 36)
This law ensures that, if a community fails to qualify for the federal flood insurance program, the State will develop flood hazard regulations for that community to make it eligible for participation in the program. The regulations are, at a minimum, those specified by the Federal Emergency Management Agency.

State agencies are also constrained by this law through regulation of such activities as the financing of projects, or the authorization of implementation of projects, on State lands. The regulations are, at a minimum, those specified by the federal flood insurance program.
3. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires: (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act, one of which requires the use of non-structural measures whenever possible to minimize damage from flooding and erosion. This provision of law is implemented by amendments to SEQR (see 4 below) and by Department of State regulations. Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Whenever possible, use non-structural measures to minimize damage to natural resources and property from flooding and erosion. Such measures shall include: (i) the set back of buildings and structures; (ii) the planting of vegetation and the installation of sand fencing

and drainage systems; (iii) the reshaping of bluffs; and (iv) the flood-proofing or elevation of buildings above the base flood level.” (2) That the Secretary of State shall review actions of State agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the use of setbacks as a non-structural measure.

Section 2 of the law requires that State agencies analyze their programs’ consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

4. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Whenever possible, use non-structural measures to minimize damage to natural resources and property from flooding and erosion. Such measures shall include: (i) the set back of buildings and structures; (ii) the planting of vegetation and the installation of sand fencing and drainage systems; (iii) the reshaping of bluffs; and (iv) the flood-proofing or elevation of buildings above the base flood level.”
5. State and Local Natural and Man-made Disaster Preparedness Act, Executive Law (Article 2-B)
This law provides for the establishment of a State Disaster Preparedness Commission and the preparation of a State Disaster Preparedness Plan. The Act also declares that it is a policy of the State that local governments “continue their essential role as the first line of defense in times of disaster” and authorizes counties and cities to prepare Local Disaster Preparedness Plans.
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
8. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
10. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
11. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 12

Activities or development in the coastal area will be undertaken so as to minimize damage to natural resources and property from flooding and erosion by protecting natural protective features including beaches, dunes, barrier islands and bluffs.

A. Explanation of Policy

Beaches, dunes, barrier islands, bluffs, and other natural protective features help safeguard coastal lands and property from damage, as well as reduce the danger to human life, resulting from flooding and erosion. Excavation of coastal features, improperly designed structures, inadequate site planning, or other similar actions which fail to recognize their fragile nature and high protective values, lead to the weakening or destruction of those landforms. Activities or development in, or in proximity to, natural protective features must ensure that all such adverse effects are minimized. Primary dunes will be protected from all encroachments that could impair their natural protective capacity.

B. State Means for Implementing the Policy**1. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)**

This law requires the identification of coastal erosion hazard areas, including natural protective features such as beaches, dunes, bluffs and barrier islands. Standards and criteria are also authorized for the promulgation of regulations which will require that activities and development will have minimal adverse effects on such natural protective features.

2. Flood Plain Management Act, Environmental Conservation Law (Article 36)

(See also Policy 11, B, 2 above)

Regulations promulgated under this law include a prohibition on the alteration of sand dunes in coastal high hazard areas so as to prevent an increase in potential flood damage to lands and property.

3. Water Resources Law, Environmental Conservation Law (Article 15)

Environmental Conservation Law Article 15, Title 5, Sections 0503 and 0505 regulate the placement of permanent docks, piers and similar structures, as well as the placement of fill, in the waters of the State. The law also recognizes the adverse effect of such activities on soil erosion and will be used to implement this policy.

4. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires (1) that State agencies actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act, one of which requires that damage to natural resources from flooding and erosion be minimized, including the protection of beaches, dunes, barrier islands, bluffs and other natural protective features. This provision of law is implemented by amendments to SEQRA (see 5 below) and by Department of State regulations. Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Activities or development

in the coastal area will be undertaken so as to minimize damage to natural resources and property from flooding and erosion by protecting natural protective features including beaches, dunes, barrier islands and bluffs. Primary dunes will be protected from all encroachments that could impair their natural protective capacity.” (2) That the Secretary of State shall review actions of State agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the adverse effect of activities or development on natural protective features.

Section 2 of the law requires that State agencies analyze their programs’ consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

5. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Activities or development in the coastal area will be undertaken so as to minimize damage to natural resources and property from flooding and erosion by protecting natural protective features including beaches, dunes, barrier islands and bluffs. Primary dunes will be protected from all encroachments that could impair their natural protective capacity.”
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
8. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
10. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
11. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 13

The construction or reconstruction of erosion protection structures shall be undertaken only if they have reasonable probability of controlling erosion for at least thirty years as demonstrated in design and construction standards and/or assured maintenance or replacement programs.

A. Explanation of Policy

Erosion protection structures are widely used throughout the State’s coastal area. However, because of improper design, construction and maintenance standards, many fail to give the protection,

which they were presumed to provide. As a result, development is sited in areas where it is subject to damage or loss due to erosion. This policy will help ensure the reduction of such damage or loss.

B. State Means for Implementing the Policy

1. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
Within coastal erosion hazard areas identified by this law, standards and criteria, required by the Act will be used to regulate the construction or reconstruction and maintenance of erosion protection structures.
2. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires (1) that State agencies actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act, one of which states that it is State policy to minimize damage to property from erosion. This provision of law is implemented by amendments to SEQR (see 3 below) and by Department of State regulations. Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: The construction or reconstruction of erosion protection structures shall be undertaken only if they have a reasonable probability of controlling erosion for at least thirty years as demonstrated in design and construction standards and/or assured maintenance or replacement programs.” (2) That the Secretary of State shall review actions of State agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the adverse effect of improperly designed, constructed or maintained erosion protection structures.

Section 2 of the law requires that State agencies analyze their programs’ consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.
3. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “The construction or reconstruction of erosion protection structures shall be undertaken only if they have a reasonable probability of controlling erosion for at least thirty years as demonstrated in design and construction standards and/or assured maintenance or replacement programs.”
4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

8. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
9. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 14

Activities and development including the construction or reconstruction of erosion protection structures, shall be undertaken so that there will be no measurable increase in erosion or flooding at the site of such activities or development, or at other locations.

A. Explanation of Policy

Erosion and flooding are processes which occur naturally. However, by our actions, humans can increase the severity and adverse effects of those processes, causing damage to, or loss of property, and endangering human lives. Those actions include: the use of erosion protection structures such as groins, or the use of impermeable docks which block the littoral transport of sediment to adjacent shorelands, thus increasing their rate of recession; the failure to observe proper drainage or land restoration practices, thereby causing runoff and the erosion and weakening of shorelands; and the placing of structures in identified floodways so that the base flood level is increased causing damage in otherwise hazard-free areas.

B. State Means for Implementing the Policy

1. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
Within coastal erosion hazard areas identified pursuant to this law, standards and criteria will be established to regulate activities and development, including the construction or reconstruction of erosion control structures, so that on-site erosion, and erosion of other lands, will not measurably increase.
2. Water Resources Law, Environmental Conservation Law (Article 15)
Environmental Conservation Law Article 15, Title 5, Sections 0503 and 0505 regulate the placement of permanent docks, piers and similar structures, as well as the placement of fill, in the waters of the State. The law also recognizes the adverse effect of such activities on soil erosion and will be used to implement this policy.
3. Flood Plain Management Act, Environmental Conservation Law (Article 36)
(See also Policy 11, B, 2 above)
This law regulates encroachments in floodways identified under the federal flood insurance program so as to prevent increases in flood-water levels.
4. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act, one of which states that it is State policy to minimize damage to natural resources and property from flooding and erosion. This provision of law is implemented by amendments to SEQR (see 5 below) and by Department of State

regulations. Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Activities and development including the construction or reconstruction of erosion protection structures, shall be undertaken so that there will be no measurable increase in erosion or flooding at the site of such activities or development or at other locations.” (2) That the Secretary of State shall review actions of State agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the adverse effect of activities or development upon coastal lands.

Section 2 of the law requires that State agencies analyze their programs’ consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

5. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Activities and development including the construction or reconstruction of erosion protection structures, shall be undertaken so that there will be no measurable increase in erosion or flooding at the site of such activities or development or at other locations.”
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
8. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
11. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 15

Mining, excavation or dredging in coastal waters shall not significantly interfere with the natural coastal processes which supply beach materials to land adjacent to such waters and shall be undertaken in a manner which will not cause an increase in erosion of such land.

A. Explanation of Policy

Coastal processes, including the movement of beach materials by water, and any mining, excavation or dredging in nearshore or offshore waters which changes the supply and net flow of such materials can deprive shorelands of their natural regenerative powers. Such mining, excavation and dredging should be accomplished in a manner so as not to cause a reduction of

supply, and thus an increase of erosion, to such shorelands. Offshore mining is a future alternative option to land mining for sand and gravel deposits which are needed to support building and other industries.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires (1) that State agencies actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act, one of which requires that damage to natural resources from erosion is minimized. This provision of law is implemented by amendments to SEQR (see 2 below) and by Department of State regulations. Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Mining, excavation or dredging in coastal waters shall not significantly interfere with the natural coastal processes which supply beach materials to land adjacent to such waters and shall be undertaken in a manner which will not cause an increase in erosion of such land.” (2) That the Secretary of State shall review actions of state agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the adverse effect of mining, excavation and dredging upon coastal lands.

Section 2 of the law requires that State agencies analyze their programs consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. The environment is broadly defined to include land and minerals: hence, sand, gravel, and other materials in coastal waters are viewed as environmental resources. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Mining, excavation or dredging in coastal waters shall not significantly interfere with the natural coastal processes which supply beach materials to land adjacent to such waters and shall be undertaken in a manner which will not cause an increase in erosion of such land.”

3. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)

This law provides for the identification of coastal erosion hazard areas, including nearshore natural protective features such as shoals, bars and spits, which if altered might lower the reserves of sand or other natural materials available to replenish storm losses through natural processes. The law requires also that excavation or other alteration of land will be regulated to minimize adverse effects on those natural protective features as well as to prevent erosion of other lands.

4. Grants of Land Under Water, Public Lands Law (Article 6)
New York State owns the underwater lands in the State's coastal area, except where its rights have been sold, leased or otherwise transferred, or where they have been reserved to other interests. This law provides for the leasing of certain underwater lands for the mining of sand and gravel. Such mining activities must be implemented consistent with the policies of Environmental Conservation Law, Article 34.
5. Water Resources Law, Environmental Conservation Law (Article 15)
This law recognizes the adverse effects on soil erosion of activities such as excavation in the State's navigable waters, or in marshes, estuaries, tidal marshes and wetlands adjacent thereto, and requires the regulation of such activity by permit.
6. Tidal Wetlands Act, Environmental Conservation Law (Article 25)
The regulatory jurisdiction of this law in the State's tidal waters includes: (1) coastal shoals, bars and flats, as well as other lands no more than 6 feet underwater at low mean water, and adjacent areas; and (2) the dredging, excavation or removal of sand, or other aggregate. To protect the contribution which those lands make to flood, hurricane and storm control, those uses are presumed incompatible and a permit must be obtained from the Department of Environmental Conservation, upon demonstration that those values will not be adversely affected.
7. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
This law provides for the identification of freshwater wetlands and for the regulation of activities therein, including dredging, mining and excavation.
8. Environmental Protection Act, Environmental Conservation Law (Article 54)
9. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
10. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
11. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
12. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
13. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 16

Public funds shall only be used for erosion protective structures where necessary to protect human life, and new development which requires a location within or adjacent to an erosion hazard area to be able to function, or existing development; and only where the public benefits outweigh the long term monetary and other costs including the potential for increasing erosion and adverse effects on natural protective features.

A. Explanation of Policy

Public funds are used for a variety of purposes on the State's shorelines. This policy recognizes the public need for the protection of human life and existing investment in development or new development which requires a location in proximity to the coastal area or in adjacent waters to be able to function. However, it also recognizes the adverse impacts of such activities and development on the rate of erosion and on natural protective features and requires that careful analysis be made of such benefits and long-term costs prior to expending public funds.

B. State Means for Implementing the Policy

1. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
This law contains a provision that, within identified coastal erosion hazard areas, consideration be given to both the public benefits and long range adverse effects of proposed activities and development which use public funds.

2. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this law, one of which requires that damage from erosion to natural resources and property is minimized by proper location of new development, protection of critical coastal features and the use of non-structural measures whenever possible. This provision of law is implemented by amendments to SEQR (see 3 below) and by Department of State regulations.

Those Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Public funds shall only be used for erosion protective structures where necessary to protect human life, and new development which requires a location within or adjacent to an erosion hazard area to be able to function, or existing development; and only where the public benefits outweigh the long term monetary and other costs including the potential for increasing erosion and adverse effects on natural protective features." (2) The Secretary of State shall review actions of State agencies that may affect achievement of the policy and (3) that SEQR regulations be amended to reflect consideration of the costs and benefits of publicly funded erosion protective structures.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

3. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Public funds shall only be used. for erosion protective structures where necessary to protect human life, and

new development which requires a location within or adjacent to an erosion hazard area to be able to function, or existing development; and only where the public benefits outweigh the long term monetary and other costs including the potential for increasing erosion and adverse effects on natural protective features.”

4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
8. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
9. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 17

Non-structural measures to minimize damage to natural resources and property from flooding and erosion shall be used whenever possible.

A. Explanation of Policy

1. This policy recognizes both the potential adverse impacts of flooding and erosion upon development and upon natural protective features in the coastal area as well as the costs of protection against those hazards which structural measures entail.
2. “Non-structural measures” shall include, but not be limited to: (1) within coastal erosion hazard areas identified under Section 0104 of Coastal Erosion Hazard Areas law, (Environmental Conservation Law Article 34), and subject to the permit requirements on all regulated activities and development established under that Law, (a) the use of minimum setbacks as provided for in Section 0108 of Environmental Conservation Law Article 34; and (b) the strengthening of coastal landforms by the planting of appropriate vegetation on dunes and bluffs, the installation of sand fencing on dunes, the reshaping of bluffs to achieve an appropriate angle of repose so as to reduce the potential for slumping and to permit the planting of stabilizing vegetation, and the installation of drainage systems on bluffs to reduce runoff and internal seepage of waters which erode or weaken the landforms; and (2) within identified flood hazard areas, (a) the avoidance of risk or damage from flooding by the siting of buildings outside the hazard area, and (b) the flood-proofing of buildings or their elevation above the base flood level.
3. This policy shall apply to the planning, siting and design of proposed activities and development, including measures to protect existing activities and development. To ascertain consistency with the policy, it must be determined if any one, or a combination of, non-structural measures would afford the degree of protection appropriate both to the character and purpose of the activity or development, and to the hazard. If non-structural measures are determined to offer sufficient protection, then consistency with the policy would require the use of such measures, whenever possible.

4. In determining whether or not non-structural measures to protect against erosion or flooding will afford the degree of protection appropriate, an analysis, and if necessary, other materials such as plans or sketches of the activity or development, of the site and of the alternative protection measures should be prepared to allow an assessment to be made.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities, must be consistent with the policies of this law, one of which calls for minimizing damage to natural resources and property from flooding and erosion by the use of non-structural measures whenever possible. This provision of law is implemented by amendments to SEQR (See 2 below) and by the Department of State regulations. The Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is "Whenever possible, use non-structural measures to minimize damage to natural resources and property from flooding and erosion. Such measures shall include: (i) the set back of buildings and structures; (ii) the planting of vegetation and the installation of sand fencing and drainage systems; (iii) the reshaping of bluffs; and (iv) the flood-proofing of buildings or their elevation above the base flood level." (2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and (3) that SEQR regulations be amended to reflect consideration of the use of nonstructural measures to minimize damage from flooding and erosion.
2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Whenever possible, use nonstructural measures to minimize damage to natural resources and property from flooding and erosion. Such measures shall include: (i) the set back of buildings and structures; (ii) the planting of vegetation and the installation of sand fencing and drainage systems; (iii) the reshaping of bluffs; and (iv) the flood-proofing of buildings or their elevation above the base flood level."
3. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
Within coastal erosion hazard areas identified pursuant to this law, standards and criteria will be established to regulate activities and development as well as to protect natural protective features such as dunes, bluffs, beaches and barrier islands through a permit system.
4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)

6. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 18

To safeguard the vital economic, social and environmental interests of the State and of its citizens, proposed major actions in the coastal area must give full consideration to those interests, and to the safeguards which the State has established to protect valuable coastal resource areas.

A. Explanation of Policy

Proposed major actions may be undertaken in the coastal area if they will not significantly impair valuable coastal waters and resources, thus frustrating the achievement of the purposes of the safeguards which the State has established to protect those waters and resources. Proposed actions must take into account the social, economic and environmental interests of the State and its citizens in such matters that would affect natural resources, water levels and flows, shoreline damage, hydro-electric power generation, and recreation.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

In part, Article 42 declares that it is the public policy of the State within its coastal area to: conserve and protect fish and wildlife and their habitats; achieve a balance between economic development and preservation needs that will permit the beneficial use of coastal resources while preventing permanent adverse changes to ecological systems; and minimize damage to natural resources and property from flooding and erosion. The law's policies also call for the assurance of consistency of State actions and federal actions with policies within the coastal area and cooperation and coordination with other states, the federal government and Canada to attain a consistent policy towards coastal management". Section 919 of Article 42 requires (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities, must be consistent with the policies of the law. This provision of law is implemented by amendments to SEQRA (See 2 below) and by the Department of State regulations. The Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "To safeguard the vital economic, social, and environmental interests of the State and of its citizens, proposed major actions in the coastal area must give full consideration to those interests, and to the safeguards which the State has established to protect valuable coastal resource areas." The law also requires (2) that

the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and (3) that SEQR regulations be amended to reflect consideration of this policy.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action which might have a significant effect on the environment. Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "To safeguard the vital economic, social, and environmental interests of the State and of its citizens, proposed major actions in the coastal area must give full consideration to those interests, and to the safeguards which the State has established to protect valuable coastal resource areas."
3. Water Resources Law, Environmental Conservation Law (Article 15)
Environmental Conservation Law Article 15, Title 1, Section 0103 states in part that "... the sovereign power to regulate and control the water resources of this State ever since its establishment has been and now is vested exclusively in the State of New York except to the extent of any delegation of powers to the United States..."
4. Wild, Scenic and Recreational Rivers System, Environmental Conservation Law (Article 15, Title 27)
Along stretches of rivers designated by the State as "wild", "scenic", or "recreational", the State Department of Environmental Conservation is authorized by this law to exercise land use controls in order to protect the outstanding natural, scenic, historic, ecological and recreational resources of these rivers.
5. Protection of Water, Environmental Conservation Law (Article 15, Title 5)
This law was enacted to minimize disturbances to the beds and banks of certain streams (Class C (t) and above) which cause increased turbidity, and irregular variations in velocity, temperature and water levels, in order to protect fish and wildlife and their habitats. The Department of Environmental Conservation regulates dredging and filling in navigable waters and adjacent wetlands, and construction of certain dams and docks. Further, it requires the removal, replacement or repair of illegal or unsafe structures, fills or excavations.
6. Tidal Wetlands Act, Environmental Conservation Law (Article 25)
This Act requires that a permit be issued for activities or development in identified tidal wetlands. It must be demonstrated that proposed activities or development will not adversely affect water quality, flood and storm control, marine food production, wildlife habitat, open space, and aesthetically significant areas.

7. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
This law recognizes the value of freshwater wetlands in providing flood protection, wildlife habitats, open space and water resources. The program established under this Act regulates activities such as draining, dredging, and filling. It is administered by local governments pursuant to state guidelines and after official filing of wetland maps by the State. The Department of Environmental Conservation regulates fresh water wetlands through its interim permit program in communities where maps have yet to be filed. Before granting or denying a permit, the municipality or DEC must determine if the activity will have an adverse impact on the value of the wetland.
8. General Powers and Duties of the Department of Environmental Conservation, Environmental Conservation Law (Article 11, Title 3)
The Department of Environmental Conservation is empowered by this law to manage the State's fish and wildlife resources. The Department propagates fish and wildlife to supplement existing stocks, regulates their harvest through restricted seasons, bag limits, gear restrictions, and develops new or improves existing habitats with such devices as stream improvement structures.
9. Polluting Streams Prohibited, Environmental Conservation Law (Article 11, Title 5, Section 0503)
Deleterious or poisonous substances (e.g., dyestuffs, coal tar, and refuse from a gas house) may not be discharged into any waters either private or public, in quantities injurious to fish life, protected wildlife or waterfowl inhabiting those waters or injurious to the propagation of fish, protected wildlife or waterfowl. Also vessel wastes (oil, sludge cinders or ashes) may not be discharged into the Hudson River.
10. State Pollutant Discharge Elimination System, Environmental Conservation Law (Article 17, Title 8)
The Department of Environmental Conservation regulates all industrial, commercial and municipal discharges, as well as those from residential subdivisions of five or more lots, into the state's surface and ground-waters. Through this program, the State can control the discharge of toxics and other pollutants from point sources which contaminate valuable resources.
11. Protection of Waters; Cesspools and Drains, Environmental Conservation Law (Article 13, Title 3, Section 0345) and Prohibition Against Pollution of Waters of Marine District, Environmental Conservation Law (Article 17, Title 5, Section 0503)
These sections of the law provide for the protection of shellfish and finfish from contaminants (e.g., sludge, acid, refuse, and sewage) which affect the flavor, odor, color, or sanitary condition of these fishery resources.
12. Substances Hazardous or Acutely Hazardous to Public Health, Safety or the Environment, Environmental Conservation Law (Article 37)

Substances, which are hazardous and tend to accumulate in the food chain, threaten fish and wildlife and other living coastal resources. The State recently passed this law in an effort to control the discharge of hazardous substances into the environment. Rules and regulations pertaining to the storage and discharge of these substances are under preparation. The hazardous substances identified will be included within these rules and regulations.

13. Industrial Hazardous Waste Management, Environmental Conservation Law (Article 27, Title 9)

The Department of Environmental Conservation (DEC) regulates the handling of hazardous wastes generation, storage, transportation, treatment and disposal in a manner consistent with the federal Resource Conservation and Recovery Act of 1976 (RCRA). This state law mandates DEC to identify and list hazardous wastes, to develop and implement a manifest system for tracking the wastes “from cradle to grave”, to regulate all phases of handling hazardous wastes. Enforcement of this law will minimize new introductions of hazardous wastes into the environment, thereby protecting coastal resources.

14. Oil Spill Prevention, Control and Compensation, Navigation Law (Article 12)

Unregulated discharge of petroleum or oil spills associated with the transport and storage of such products can damage the State’s coastal fish, shellfish, wildlife, beaches and other resources. This law authorizes the Department of Transportation and the Department of Environmental Conservation to control the methods of petroleum storage and transfer and to require prompt cleanup and compensation to damaged parties when spills or discharges occur.

15. Public Water Supplies; Sewerage and Sewage Control, Public Health Law (Article 11)

This law provides for the Department of Health to make rules and regulations for the protection from contamination of public supplies of potable waters.

16. Solid Waste Management and Resource Recovery Facilities, Environmental Conservation Law (Article 27, Title 7)

Garbage, refuse, industrial and commercial wastes, incinerator residue, sludge and other solid wastes can cause physiological disorders in fish and wildlife and contaminate their habitats if not treated and disposed of properly. The construction and operation of solid wastes management facilities are regulated as authorized by this law, and such regulations are directed at the prevention or reduction of pollution of resources.

17. Transportation of Hazardous Materials, Transportation Law (Article 2, Section 14-F)

This law authorizes the Commissioner of Transportation to regulate the transportation of hazardous materials.

18. Flood Plain Management Act, Environmental Conservation Law (Article 36)

This law ensures that, if a community fails to qualify for the federal National Flood Insurance Program, the State will develop flood hazard regulations for that community to make it eligible for participation in the program. The regulations are, at a minimum, those

specified by, the federal program, administered by the Federal Emergency Management Agency.

State agencies are also constrained by this law through regulation of such activities as the financing of projects, or the authorization of implementation of projects on state lands. The regulations are, at a minimum, those specified by the federal National Flood Insurance Program.

19. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
This law provides for the identification of coastal erosion hazard areas, including natural protective features such as beaches, dunes, barrier islands and nearshore areas, and coastal lands subject to significant erosion. Standards and criteria are also prescribed for the regulation of activities and development in relation to those defined areas so as to minimize damage to natural resources and property from erosion.
20. Protection of Natural and Man-Made Beauty, Environmental Conservation Law (Article 49)
Under this law, DEC has the power and duty to: (1) develop policies and programs to preserve and enhance the natural and human-made beauty of the State and (2) “designate scenic sites, areas and highways in the State and develop programs for their preservation and enhancement.”
21. Implementation of Environmental Quality Bond Act of 1972, Environmental Conservation Law (Article 51)
Title 7 of Article 51 directs the Department of Environmental Conservation to appropriate monies from the Environmental Quality Bond Act for land preservation and improvement projects. These projects include acquisition of important tidal and freshwater wetlands. Acquisition of Real Property by Purchase or Appropriation, Environmental Conservation Law (Article 3, Title 3, Section 0305) gives the Department of Environmental Conservation the power to acquire property for any of the functions of the Department.
22. Stream Rights Acquisition, Environmental Conservation Law (Article 51, Title 7, Section 0701, Subsection 4)
This law enables the Department of Environmental Conservation to acquire access rights (fee-simple or less-than-fee simple) on quality streams guaranteeing fishermen access to various stretches of streams and rivers.
23. New York State Historic Preservation Act of 1980 (State Board for Historic Preservation, Parks and Recreation Law (Title B, Article 11, Section 11.03); Powers, Functions and Duties, Parks and Recreation Law (Title B, Article 11, Section 11.09); Historic Preservation, Parks and Recreation Law (Title C, Article 14); Historic and Cultural Properties, Public Buildings Law (Article 4-B); Historic Preservation, General Municipal Law (Article 5-K))
The New York State Historic Preservation Act greatly expands the responsibilities of New York State agencies and municipalities with regard to historic preservation. Specifically the Act provides several means for preserving the historic architectural, archeological, and cultural resources of the State (including resources under water). Each State agency must

designate a historic preservation officer to coordinate and implement state historic preservation programs. A State Register of historic places is created and an inventory of properties which may qualify for the Register is established. A Statewide Preservation Plan is to be prepared and updated annually. A review process has been established, to be undertaken concurrently with existing environmental reviews; this process requires State agencies to consult with the Commissioner of Parks, Recreation and Historic Preservation if a state-funded project will have an adverse effect upon a historic property. The review process requires consideration of alternatives and those adverse effects he avoided or mitigated. The Secretary of State is added to State Board of Historic Preservation, and the Commissioner of the Office of General Services is required to consider the use and restoration of historic buildings in meeting the State's needs for building space.

24. General Functions, Powers and Duties, Parks and Recreation Law (Title B, Article 3, Section 3.09)

This statute authorizes the NYS Office of Parks, Recreation and Historic Preservation to acquire, establish, operate, and maintain state parks, parkways, historic sites, and state recreational facilities.

25. State Nature and Historical Preserve Trust; Environmental Conservation Law (Article 45)

This program provides for acquisition, when authorized by act of the Legislature, of real property (including less than fee interests) and administration of lands, outside the Forest Preserve counties, "... of special natural beauty, wilderness character or geological, ecological, or historical significance."

26. New York State Park Preserve System, Parks and Recreation Law (Article 20)

This legislation gives the Office of Parks, Recreation and Historic Preservation the power (in conjunction with Section 3.09 of Parks and Recreation Law, authorizing acquisition of land for state recreational facilities) to purchase park preserve areas in or near metropolitan regions in order to "maintain the integrity of fauna..." and to "provide for the management of all unique, rare, or endangered species of fauna within park preserves areas." By purchasing fish and wildlife habitat areas for passive recreational uses, their preservation and management is assured.

27. Harbors of Refuge, Navigation Law (Article 11, Section 141)

This law authorizes the Office of Parks, Recreation and Historic Preservation to enter into agreement with the federal government and with municipalities to construct, operate, and maintain such harbors. Priorities for locating harbors of refuge are determined by the State Comprehensive Recreation Plan Priority System.

28. State Marine Facilities, Navigation Law (Article 11, Section 143)

This section of the Navigation Law authorizes the State to construct, operate, and maintain State marine facilities, including that incidental to a harbor of refuge. Priorities for location of these facilities are also determined by the State Comprehensive Recreation Plan Priority System.

29. Local Marine Facilities, Navigation Law (Article 11, Section 142)

Municipalities can help meet the demand for marinas by participating in this program which authorizes state financial assistance to municipalities in the construction of local marine facilities, including that incidental to a harbor of refuge. Priorities for giving financial assistance to municipalities are determined by the State Comprehensive Recreation Plan Priority System.

30. Environmental Protection Act, Environmental Conservation Law (Article 54)
31. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
32. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
33. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
34. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
35. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
36. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
37. Water Supply, Environmental Conservation Law (Article 15, Title 15, Sections 1501, 1502, 1503, 1504, 1505, 1521, and 1529)

The Act regulates all water withdrawal systems with the capability of withdrawing 100,000 gallons per day or more. The Act requires the New York State Department of Environmental Conservation to promulgate regulations that implement a permitting program for water withdrawals, including to make a water withdrawal from an existing or new source or an increased water withdrawal from an existing permitted source; to take or condemn lands for the protection of any existing sources of public water supply; or for the development or protection of any new or additional sources of public water supply; to commence or undertake the construction of any works or projects in connection with the proposed withdrawal; or to extend its supply or distribution mains into any new water service area or extension that has not been approved by the department or a predecessor commission; or to make a significant change in the principal use of the water withdrawal system from that specified in the permit, or permit application. The promulgated regulations must also include: minimum standards for operation and new construction of water withdrawal systems; reporting requirements for water withdrawals used for agricultural purposes; permit requirements for transporting water withdrawals to other states or basins; permit requirements for withdrawals of water for a public water supply system; and requirements for the approval of completed construction of a water withdrawal systems. Such regulations may establish quantitative standards that maintain stream flows protective of aquatic life, and any other conditions, limitations and restrictions that protect the environment and the public health, safety and welfare and to ensure the proper management of the waters of the state.

38. Energy Planning, Energy Law (Article 6)

New York’s State Energy Plan is adopted every four years to set forth a vision to advance the State’s energy future in a cost-effective and sustainable manner. The plan is prepared pursuant to Energy Law Article 6 requirements and provides direction to state agencies making decisions concerning energy facility licensing and the location of transmission facilities. Any siting or development of energy facilities or power transmission facilities along the coast must consider State Energy Plan guidelines. Any energy-related action or decision of a state agency, board, commission or authority must be reasonably consistent with the forecasts and the policies and long-range energy planning objectives and strategies contained in the Plan, including its most recent update; provided, however, that any such action or decision which is not reasonably consistent with the Plan will be deemed in compliance, provided that such action or decision includes a finding that the relevant provisions of the Plan are no longer reasonable or probable based on a material and substantial change in fact or circumstance, and a statement explaining the basis for this finding. A state agency, board, commission or authority may take official notice of the most recent State Energy Plan adopted by the Board prior to any final energy-related decision by such agency, board, commission or authority.

39. 2015 New York State Energy Plan

The State Energy Plan is a comprehensive plan, completed pursuant to Energy Law Article 6, to build a clean, resilient, and affordable energy system for the State of New York. The Plan coordinates the efforts of all state agencies and authorities to advance New York’s energy policies, including regulatory reform; integrating renewable and clean energy, including locally generated power, into the power grid; programs to foster private capital investments; and deployment of energy solutions throughout state owned public facilities and operations. The plan advances economic development along with environmental stewardship in the pursuit of state clean energy goals, including a 40% reduction in greenhouse gas emissions from 1990 levels; 50% of energy generation from renewable energy sources; and a 23% reduction in energy consumption by buildings, which equals a 600 trillion Btu increase in statewide energy efficiency. The Energy Plan is divided into two volumes. The first volume contains actionable policy recommendations and analyses to guide New York State’s efforts to advance new energy technologies that foster an innovative clean energy economy. The second volume addresses energy use, its sources and impacts, and provides detailed background that was used to develop the overarching vision and initiatives in the first volume. In addition, the second volume provides forecasts for energy supply and demand, a statewide inventory of greenhouse gas emissions, environmental and public health impacts associated with energy production and use, and vulnerabilities of the energy system. Development of the Plan is directed by the New York State Energy Planning Board in accordance with the New York State Energy Law Article 6: Energy Planning.

40. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

41. New York State Public Service Commission Order Adopting a Clean Energy Standard (Cases 15-E-0302 and 16-E-0270 - Issued and Effective August 1, 2016)

The New York State Public Service Commission adopts the New York State Energy Plan (SEP) goal mandating that 50% of New York’s electricity is to be generated by renewable

sources by 2030 as part of a strategy to reduce statewide greenhouse gas emissions by 40% by 2030. The PSC Order also adopts a Clean Energy Standard (CES) consistent with the SEP goal in order to fight climate change, reduce harmful air pollution, and ensure a diverse and reliable energy supply. The PSC Order includes (a) program and market structures to encourage consumer-initiated clean energy purchases or investments; (b) obligations on load serving entities to financially support new renewable generation resources to serve their retail customers; (c) a requirement for regular renewable energy credit (REC) procurement solicitations; (d) obligations on distribution utilities on behalf of all retail customers to continue to financially support the maintenance of certain existing at-risk small hydro, wind and biomass generation attributes; (e) a program to maximize the value potential of new offshore wind resources; and (f) obligations on load serving entities to financially support the preservation of existing at-risk nuclear zero-emissions attributes to serve their retail customers.

42. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6. Chapter IV. Subchapter H. Part 487)
43. State Energy Planning Procedures (New York Codes, Rules and Regulations Title 9, Subtitle BB, Chapter III, Subchapter B, Parts 7844-7852)
44. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 19

Protect, maintain, and increase the level and types of access to public water related recreation resources and facilities.

A. Explanation of Policy

This policy calls for achieving balance among the following factors: the level of access to a resource or facility, the capacity of a resource or facility, and the protection of natural resources. The imbalance among these factors is the most significant in the State's urban areas. Because this is often due to access-related problems, priority will be given to improving physical access to existing and potential coastal recreation sites within the heavily populated urban coastal areas of the State and to increasing the ability of urban residents to get to coastal recreation areas by improved public transportation. The particular water related recreation resources and facilities which will receive priority for improved access are public beaches, boating facilities, fishing areas and waterfront parks. In addition, because of the greater competition for waterfront locations within urban areas, the Coastal Management Program will encourage mixed use areas and multiple-use of facilities to improve access. Specific sites requiring access improvements and the relative priority the program will accord to each will be identified in the Public Access Planning Process.

The following guidelines will be used in determining the consistency of a proposed action with this policy:

1. The existing access from adjacent or proximate public lands or facilities to public water-related recreation resources and facilities shall not be reduced, nor shall the possibility of increasing access in the future from adjacent or proximate public lands or facilities to public water-related recreation resources and facilities be eliminated, unless in the latter case, estimates of future use of these resources and facilities are too low to justify maintaining or providing increased public access, or unless such actions are found to be necessary or beneficial by the public body having jurisdiction over such access as the result of a reasonable justification of the need to meet system-wide objectives.

The following is an explanation of the terms used in the above guidelines:

- a. Access - the ability and right of the public to reach and use public coastal lands and waters.
- b. Public water-related recreation resources or facilities - all public lands, or facilities suitable for passive or active recreation that requires either water or a waterfront location or is enhanced by a waterfront location.
- c. Public lands or facilities - lands or facilities held by State or local government in fee simple or less-than-fee simple ownership and to which the public has access or could have access, including underwater lands and the foreshore.
- d. A reduction in the existing level of public access - includes but is not limited to the following:
 - (1) The number of parking spaces at a public water-related recreation resource or facility is significantly reduced.
 - (2) The service level of public transportation to a public water-related recreation resource or facility is significantly reduced during peak season use and such reduction cannot be reasonably justified in terms of meeting system-wide objectives.
 - (3) Pedestrian access is diminished or eliminated because of hazardous crossings required at new or altered transportation facilities, electric power transmission lines, or similar linear facilities.
 - (4) There are substantial increases in the following: already existing special fares (not to include regular fares in any instance) of public transportation to a public water-related recreation resource or facility except where the public body having jurisdiction over such fares determines that such substantial fare increases are necessary; and/or admission fees to such a resource or facility, and analysis shows that such increases will significantly reduce usage by individuals or families with incomes below the State government established poverty level.
- e. An elimination of the possibility of increasing public access in the future includes, but is not limited to the following:
 - (1) Construction of public facilities which physically prevent the provision, except at great expense, of convenient public access to public water-related recreation resources and facilities.

- (2) Sale, lease, or other transfer of public lands that could provide public access to a public water-related recreation resource or facility.
 - (3) Construction of private facilities which physically prevent the provision of convenient public access to public water-related recreation resources or facilities from public lands and facilities.
2. Any proposed project to increase public access to public water-related recreation resources and facilities shall be analyzed according to the following factors:
 - a. The level of access to be provided should be in accord with estimated public use. If not, the proposed level of access to be provided shall be deemed inconsistent with the policy.
 - b. The level of access to be provided shall not cause a degree of use which would exceed the physical capability of the resource or facility. If this were determined to be the case, the proposed level of access to be provided shall be deemed inconsistent with the policy.
 3. The State will not undertake or fund any project which increases access to a water-related resource or facility that is not open to all members of the public.
 4. In their plans and programs for increasing public access to public water-related resources and facilities, State agencies shall give priority in the following order to projects located: within the boundaries of the Federal-Aid Metropolitan Urban Area and served by public transportation; within the boundaries of the Federal-Aid Metropolitan Urban Area but not served by public transportation; outside the defined Urban Area boundary and served by public transportation; and outside the defined Urban Area boundary but not served by public transportation.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: (1) that State agencies' actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for preventing diminution of public access to the waterfront and another for encouraging and facilitating public access for recreational purposes. This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, among which are the following:

 - Protect, maintain, and increase the levels and types of access to public water related recreation resources and facilities so that these resources and facilities may be fully utilized by all the public in accordance with reasonably anticipated public recreation needs and the protection of historic and natural resources. In providing such access, priority shall be given to public beaches, boating facilities, fishing areas, and waterfront parks;
 - Expand recreational use of fish and wildlife resources by increasing access to existing resources (19 NYCRR 600.5); and

- Water dependent and water enhanced recreation shall be encouraged and facilitated and shall be given priority over non-water related uses along the coast provided it is consistent with the preservation and enhancement of other coastal resources taking into account demand for such facilities. In facilitating such activities, priority shall be given to areas where access to the recreation opportunities of the coast can be provided by new or existing public transportation services and to those areas where the use of the shore is severely restricted by existing development (19 NYCRR 600.5);

(2) that the Secretary of State review actions of State agencies that may affect achievement of the policies; and (3) that SEQR regulations be amended to reflect consideration of coastal resources that can accommodate public access needs.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and the Secretary of State recommend any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have an impact upon the environment. Such actions include those contiguous to any publicly-owned or operated park land, recreation area or designated open space. Since actions deal with the provision of access, under this policy, to public water-related recreation resources and facilities, any action would require an environmental impact statement to be prepared if it exceeded 25 percent of any threshold specified for a Type I action (6 NYCRR Part 6171. In addition, Article 42 of the Executive Law requires that SEQR regulations be amended to require that environmental impact statements address coastal policies whenever a proposed action would affect achievement of a coastal policy. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8).

In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, among which are:

- Expand recreational use of fish and wildlife resources by increasing access to existing resources (19 NYCRR 600.5);
- Protect, maintain, and increase the levels and types of access to public water related recreation resources and facilities so that these resources and facilities may be fully utilized by all the public in accordance with reasonably anticipated public recreation needs and the protection of historic and natural resources. In providing such access, priority will be given to public beaches, boating facilities, fishing areas, and waterfront parks (19 NYCRR 600.5); and

- Water dependent and water enhanced recreation shall be encouraged and facilitated and shall be given priority over non-water related uses along the coast provided it is consistent with the preservation and enhancement of other coastal resources, taking into account demand for such facilities. In facilitating such activities, priority shall be given to areas where access to the recreation opportunities of the coast can be provided by new or existing public transportation services and to those areas where the use of the shore is severely restricted by existing development (19 NYCRR 600.5).
3. General Functions, Powers and Duties, Parks and Recreation Law (Title B, Article 3, Section 3.09); Acquisition of Real Property by Purchase or Appropriation, Environmental Conservation Law (Article 3, Title 3, Section 0305); Multi-Use Areas Adjacent to and Recreational, Natural and Scenic Areas Along State Highways, Highway Law (Article 2, Section 22)

One of the most effective means of providing access to public beaches and other public areas of the type listed above is acquisition of real property, including either the full fee interest in real property or some lesser interest therein, such as an easement, or contractual right to use the real property. There are presently a number of specific statutory acquisition powers which could be used to implement this public access policy. The cited Parks and Recreation Law and the Environmental Conservation Law provided broad acquisition powers to the Office of Parks, Recreation and Historic Preservation and the Department of Environmental Conservation respectively.

The State Department of Transportation is authorized to acquire land for highway and specific transportation purposes, but these acquisition powers could be used to achieve their intended purposes as well as to implement coastal access policies. In addition to the basic power to acquire property for transportation facilities per se, such powers include “Acquisition of Property...in order to provide multi-use areas adjacent to state highways and recreational, natural and scenic areas along, but not necessarily contiguous to, state highways....” (Highway Law Article 2, Section 22). This is a power which could be used to carry out a number of coastal policies involving actual physical access. The “multi-use areas” are to complement highway facilities. The statute provides that multi-use areas may include, but are not limited to walking, hiking, bicycle, and recreational vehicle trails, and there is express power to acquire less than fee interest.

Acquisitions for this program must be reviewed by the Department of State, the Office of Parks, Recreation and Historic Preservation, and the Department of Environmental Conservation. The Secretary of State will review such acquisitions which are located within the coastal area.

Pursuant to its general acquisition powers (see above), the Department of Environmental Conservation has instituted a program to acquire public fishing access to lakes, rivers and streams, including provision of boat launching sites. Substantial access has been provided through acquisition of easements on private lands. The Parks and Recreation Bond Act of 1960 and Implementation of Environmental Quality Bond Act of 1972 have provided a source of funds for such acquisition. (See Environmental Conservation Law Article 51,

Title 7, Section 0701). Within the coastal area acquisition will be made in accordance with the priorities established by the “access planning process.”

Acquisition for improved coastal access made by these agencies or other funds must be consistent with the priorities described in Policy 20.

4. Access Road Construction, Highway Law (Article 2, Section 10, Subsection 37)

This section of the Highway Law gives the Commissioner of Transportation the authority, upon request of any head of a State agency, to construct an access road from a State highway to an agency facility (the agency would, however, be required to reimburse DOT for all incurred costs). Thus, access to coastal recreational facilities may be increased at those facilities where road access has been identified as deficient.

5. Acquisition of Abandoned Railroad Transportation Property, Transportation Law (Article 2, Section 18)

Railroads are a common feature of much of New York’s coast and often restrict access to it. This section of the Transportation Law gives the Commissioner of the Department of Transportation the preferential right to acquire abandoned railroads or to authorize other appropriate State agencies, or counties, cities, towns and villages to exercise a preferential acquisition right to such abandoned property. Where such abandoned property would improve access to existing or proposed public recreation areas and there is no viable transportation use for it, the Commissioner should give priority to the public agency that has jurisdiction over such coastal lands. This Law contains a consistency provision stating that the actions of the Department of Transportation in determining preferential rights to right-of-way, where a conflict over use exists between one or more government agencies, shall take action consistent with the effectuation of State plans and policies. This provision plus the State consistency provisions of the Coastal Management Program indicate coastal management policies will influence the decision where a conflict exists.

6. Siting of Major Utility Transmission Facilities, Public Service Law (Article VII); Siting of Major Electric Generating Facilities, Public Service Law (Article 10); and Utility Transmission Facility Siting, Commission Opinion 72-3, Case #26108

Many transmission lines are located in the coastal area. Use of their rights-of-way can provide a suitable means of assuring additional access to water-related recreation opportunities including use by recreational vehicles. Under this Law a utility company is required to allocate an amount equal to two percent of the total construction cost of the transmission facilities to a fund to be used for recreational development of the right-of-way. Where the right-of-way could be used for needed additional access, this provision of the Law will be employed to provide that access. At the present time, however, recreational use of such rights-of-way is not being acted upon because of research that is underway in connection with health and safety effects which may be associated with high voltage transmission facilities.

Because power plants generally locate along the coast and a large land area around the facility is often owned by the utility, these sites present significant opportunities for

multiple uses. At a minimum they can provide additional access to water-related recreation opportunities such as fishing.

7. Fish and Wildlife Management Act, Environmental Conservation Law (Article 2, Title 5)
The Environmental Conservation Law provides for a “Fish and Wildlife Management Practices Cooperative Program”, the purpose of which is to: “...obtain on the privately owned or leased lands and waters of the state practices of fish and wildlife management which will preserve and develop the fish and wildlife resources of the state and improve access to them for recreational purposes by the people of the state.” The program is used to provide, by agreement with landowners, public rights to access to such lands for hunting and fishing purposes. Within coastal areas, efforts to obtain agreements will reflect coastal management policies.
8. Statewide Park and Recreation Plan, Parks and Recreation Law (Title B, Article 3, Section 3.15)
The State Comprehensive Recreation Plan has a priority system for allocating funds available for outdoor recreation acquisition and development projects under State and federal grant programs and the State Environmental Quality Bond Act. One of the positive-rated allocation factors is the degree to which the project contributes to the implementation of State plans such as that for Coastal Management. In addition, consistency between the Coastal Management Program and the State Comprehensive Recreation Plan will be assured by the Secretary of State’s review of such plan, and by the Waterfront Revitalization of Coastal Areas and Inland Waterways law which requires State agencies to act consistent with the law’s policies.
9. Statewide Trails System Comprehensive Plan, Parks and Recreation Law (Title B, Article 3, Section 3.09, Subdivision 7-a)
The Office of Parks, Recreation and Historic Preservation is required to promulgate a comprehensive plan for the establishment of a statewide trails system. Trails are to include footpaths, bike ways, snowmobile trails, horse trails, cross-country ski trails, roads and other rights-of-way suitable for hiking, strolling, cycling, horseback riding, skiing, and other means of motorized and non-motorized travel for recreational purposes. Included are to be combinations and systems of trails leading to scenic and recreational areas, such as those in coastal areas.
10. Environmental Protection Act, Environmental Conservation Law (Article 54)
11. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
12. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
13. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
14. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
15. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

16. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
18. Regulations Implementing Article VII of the Public Service Law (New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter F, Part 84 Transmission Facilities Management; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 85 General Procedures; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 86 General Exhibits; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 87 Exhibits for Gas Transmission; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 88 Exhibits for Electric Transmission Filings; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter H, Part 89 Notification Requirements)

POLICY 20

Access to the publicly-owned foreshore and to lands immediately adjacent to the foreshore or the water's edge that are publicly-owned shall be provided and it shall be provided in a manner compatible with adjoining uses.

A. Explanation of Policy

In coastal areas where there are little or no recreation facilities providing specific water-related recreational activities, access to the publicly-owned lands of the coast at large should be provided for numerous activities and pursuits which require only minimal facilities for their enjoyment. Such access would provide for walking along a beach or a city waterfront or to a vantage point from which to view the seashore. Similar activities requiring access would include bicycling, bird watching, photography, nature study, beachcombing, fishing and hunting.

For those activities, there are several methods of providing access which will receive priority attention of the Coastal Management Program. These include: the development of a coastal trails system; the provision of access across transportation facilities to the coast or the improvement of access to waterfronts in urban areas; and the promotion of mixed and multi-use development.

While such publicly-owned lands referenced in the policy shall be retained in public ownership, traditional sales of easements on lands underwater to adjacent onshore property owners are consistent with this policy, provided such easements do not substantially interfere with continued public use of the public lands on which the easement is granted. Also, public use of such publicly-owned underwater lands and lands immediately adjacent to the shore shall be discouraged where such use would be inappropriate for reasons of public safety, military security, or the protection of fragile coastal resources.

The regulation of projects and structures, proposed to be constructed in or over lands underwater, is necessary to responsibly manage such lands, to protect vital assets held in the name of the people of the State, to guarantee common law and sovereign rights, and to ensure that waterfront owners' reasonable exercise of riparian rights and access to navigable waters shall be consistent with the public interest in reasonable use and responsible management of waterways and such public lands for the purposes of navigation, commerce, fishing, bathing, recreation, environmental and aesthetic

protection, and access to the navigable waters and lands underwater of the State. The following guidelines will be used in determining the consistency of a proposed action with this policy:

1. Existing access from adjacent or proximate public lands or facilities to existing public coastal lands and/or waters shall not be reduced, nor shall the possibility of increasing access in the future from adjacent or nearby public lands or facilities to public coastal lands and/or waters be eliminated, unless such actions are demonstrated to be of overriding regional or statewide public benefit, or, in the latter case, estimates of future use of these lands and waters are too low to justify maintaining or providing increased access.

The following is an explanation of the terms used in the above guidelines:

- a. (See definitions under first policy of “access” and “public lands or facilities”).
 - b. A reduction in the existing level of public access - includes but is not limited to the following:
 - (1) Pedestrian access is diminished or eliminated because of hazardous crossings required at new or altered transportation facilities, electric power transmission lines, or similar linear facilities.
 - (2) Pedestrian access is diminished or blocked completely by public or private development.
 - c. An elimination of the possibility of increasing public access in the future - includes but is not limited to, the following:
 - (1) Construction of public facilities which physically prevent the provision, except at great expense, of convenient public access to public coastal lands and/or waters.
 - (2) Sale, lease, or other conveyance of public lands that could provide public access to public coastal lands and/or waters.
 - (3) Construction of private facilities which physically prevent the provision of convenient public access to public coastal lands and/or waters from public lands and facilities.
2. The existing level of public access within public coastal lands or waters shall not be reduced or eliminated.
 - a. A reduction or elimination in the existing level of public access includes but is not limited to the following:
 - (1) Access is reduced or eliminated because of hazardous crossings required at new or altered transportation facilities, electric power transmission lines, or similar linear facilities.
 - (2) Access is reduced or blocked completely by any public development.
 3. Public access from the nearest public roadway to the shoreline and along the coast shall be provided by new land use or development except where (a) it is inconsistent with public safety, military security, or the protection of identified fragile coastal resources; (b) adequate access exists within one-half mile; or (c) agriculture would be adversely affected. Such access shall

- not be required to be open to public use until a public agency or private association agrees to accept responsibility for maintenance and liability of the access way.
4. The State will not undertake or fund any project which increases access to a water-related resource or facility that is not open to all members of the public.
 5. In their plans and programs for increasing public access, State agencies shall give priority in the following order to projects located within the boundaries of the Federal-Aid Metropolitan Urban Area and served by public transportation; within the Federal-Aid Metropolitan Urban Area but not served by public transportation; outside the defined Urban Area boundary and served by public transportation; and outside the defined Urban Area boundary but not served by public transportation.
 6. Proposals for increased public access to coastal lands and waters shall be analyzed according to the following factors:
 - a. The level of access to be provided should be in accord with estimated public use. If not, the proposed level of access to be provided shall be deemed inconsistent with the policy.
 - b. The level of access to be provided shall not cause a degree of use which would exceed the physical capability of the coastal lands or waters. If this were determined to be the case, the proposed level of access to be provided shall be deemed inconsistent with the policy.
 7. In making any grant, lease, permit, or other conveyance of land now or formerly underwater, there shall be reserved such interests or attached such conditions to preserve the public interest in the use of state-owned lands underwater and waterways for navigation, commerce, fishing, bathing, recreation, environmental protection, and access to the navigable waters of the state. In particular, the granting of publicly owned underwater or formerly underwater lands to private entities will be limited to exceptional circumstances only.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for preventing diminution of public access to the waterfront and another for encouraging and facilitating public access for recreational purposes. This provision of law is implemented by amendments to SEQR (of 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Access to the publicly owned foreshore and to lands immediately adjacent to the foreshore or the water’s edge that are publicly owned shall be provided and it shall be provided in a manner compatible with adjoining uses. To ensure that such lands remain available for public use they shall be retained in public ownerships; 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3)”that SEQR

regulations be amended to reflect consideration of the use of coastal resources for including accommodation of public access needs.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Access to the publicly owned foreshore and to lands immediately adjacent to the foreshore or the water's edge that are publicly owned shall be provided in a manner compatible with adjoining uses. To ensure that such lands remain available for public use they shall be retained in public ownership."

3. Multi-Use Areas Adjacent to and Recreational, Natural and Scenic Areas Along State Highways, Highway Law (Article 2, Section 22)

Recreational, scenic and natural areas adjacent to coastal highways enhance not only the setting of the highway, but can provide access to coastal areas that, for example, would otherwise be cut off by the highway. This applies to both rural and urban areas. This section of the Highway Law could be used to provide for such areas because it authorizes the Commissioner of Transportation to acquire property in order to provide multi-use areas adjacent to State highways, and recreational, natural, and scenic areas along but not necessarily contiguous to State highways. Multi-use areas can be used for such facilities as walking, hiking, bicycle, trail-bike, recreational vehicle, and snowmobile trails. Plans for any acquisitions will be submitted to the Secretary of State for his review and recommendation. An important component of coastal trails systems would be the inclusion of bikeways, which are particularly desirable for providing access because they create few disturbances of the natural environment and are compatible with the protection of private property rights. This section of the Highway Law could be the principal means to acquire land for bikeways, since it authorizes the Commissioner of Transportation to acquire property for the purpose of constructing such facilities.

4. Acquisition of Abandoned Railroad Transportation Property, Transportation Law (Article 2, Section 18)

Where railroad transportation property in coastal areas has been abandoned for railroad transportation purposes, the potential is high for conversion of the right-of-way to a coastal trails system that will increase access to the coast. This section of the Transportation Law gives the Commissioner of Transportation the preferential right to acquire abandoned railroads, or to authorize other appropriate State agencies, metropolitan or regional transportation authorities, or counties, cities, towns and villages to exercise a preferential acquisition right to such abandoned property. The Law contains a consistency provision stating that the actions of the Department of Transportation in determining preferential rights to rights-of-way, where a conflict over use exists between one or more government agencies, shall take action consistent with the effectuation of State plans and policies. This

provision plus the State consistency provisions of the Coastal Management Program indicate coastal management policies will influence the decision where a conflict exists.

5. Statewide Trails System Comprehensive Plan, Parks and Recreation Law (Title B, Article 3, Section 3.09, Subdivision 7-a)

This provision of the Parks and Recreation Law could be used in conjunction with the above provision, since it requires the Commissioner of the Office of Parks, Recreation and Historic Preservation to promulgate a comprehensive plan for the establishment of a statewide trails system which may be implemented by the purchase and improvement of abandoned railroad rights-of-way. Through coordination with the Office of Parks, Recreation and Historic Preservation, the Coastal Management Program will ensure that development of trails in coastal areas receives a high priority, and within the coastal area the Secretary of State will identify areas where trail development should receive priority.

6. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)

Article 10 for the siting of new facilities replaces Public Service Law Article X, which expired on January 1, 2003, but is still valid for facilities licensed pursuant to it. Article 10 captures the review of the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. Siting review of new and repowered or modified major electric generating facilities in New York State is by the Board on Electric Generation Siting and the Environment (Siting Board) using a unified proceeding instead of requiring numerous state and local permits. The law requires environmental and public health impact analyses, studies regarding environmental justice and public safety, and consideration of local laws. Article 10 also requires a utility security plan reviewed by Homeland Security.

7. Development of Transportation Corridors; Multiple Use Outside the Counties of Kings and Queens of Right of Way, Transportation Law (Article 2, Section 14-E)

All transportation facilities, especially those in coastal areas, have the potential for development and multiple-use activities, including recreation and its necessary component access, in their rights-of-way. This article of the Transportation Law could be used for general access purposes to coastal areas, since it gives the Commissioner of Transportation the power to provide for the multiple-use of transportation facility rights-of-way in connection with the construction of such facilities. This applies throughout the State with the exception of Kings and Queens Counties (New York City).

8. Wild, Scenic and Recreational Rivers System, Environmental Conservation Law (Article 15, Title 27)

This statute empowers the Department of Environmental Conservation to promulgate regulations for the control of land use and development within an area up to one half mile from the banks of designated rivers. While this statute provides for police power regulations, not acquisition, the Commissioner of Environmental Conservation is authorized to order discontinuance of land uses, with payment of compensation.

Along designated rivers in coastal areas where development patterns deter access, this power could be indirectly used to facilitate the provision of access.

9. State Nature and Historical Preserve Trust, Environmental Conservation Law (Article 45)
This program provides for acquisition, when authorized by act of the Legislature, of real property (including less than fee interests) and administration of lands, outside the Forest Preserve counties, "... of special natural beauty, wilderness character or geological, ecological, or historical significance." Wherever properties are purchased in coastal areas, an indirect benefit of the program could be the improvement of access to the coast for a variety of passive activities, provided physical access would not conflict with preservation of the resource.
10. Freshwater Wetlands Act, Environmental Conservation Law (Article 24) and Tidal Wetlands Act, Environmental Conservation Law (Article 25)
These acts contain authority for programs applying both performance standards and land use regulations for the protection of wetlands. The exercise of the police power in relation to wetlands is to be accomplished within the context of the broadly stated purpose of these acts. While public access is not specifically listed, several listed purposes relate to access, including recreational benefits ("provision of areas for hunting, fishing, boating, hiking, bird watching, photography, and other uses"); "...education and scientific research by providing readily accessible outdoor bio-physical laboratories, living classrooms and vast training and education resources"; and "...open space and aesthetic appreciation by providing often the only remaining open areas along crowded river fronts and coastal Great Lakes regions..."
11. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
12. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
13. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
14. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
15. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6, Chapter IV, Subchapter H, Part 487)
16. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 21

Water dependent and water enhanced recreation will be encouraged and facilitated, and will be given priority over non-water-related uses along the coast.

A. Explanation of Policy

Water-related recreation includes such obviously water dependent activities as boating, swimming, and fishing as well as certain activities which are enhanced by a coastal location and increase the general public's access to the coast such as pedestrian and bicycle trails, picnic areas, scenic overlooks and passive recreation areas that take advantage of coastal scenery.

Provided the development of water-related recreation is consistent with the preservation and enhancement of such important coastal resources as fish and wildlife habitats, aesthetically significant areas, historic and cultural resources, agriculture and significant mineral and fossil deposits, and provided demand exists, water-related recreation development is to be increased and such uses shall have a higher priority than any non-coastal dependent uses, including non-water-related recreation uses. In addition, water dependent recreation uses shall have a higher priority over water enhanced recreation uses. Determining a priority among coastal dependent uses will require a case by case analysis.

Among priority areas for increasing water-related recreation opportunities are those areas where access to the recreation opportunities of the coast can be provided by new or existing public transportation services and those areas where the use of the shore is severely restricted by highways, railroads, industry, or other forms of existing intensive land use or development. The DOS, working with the Office of Parks, Recreation, and Historic Preservation and with local governments, will identify communities whose use of the shore has been so restricted and those sites shoreward of such developments which are suitable for recreation and can be made accessible. Priority shall be given to recreational development of such lands.

The siting or design of new public development in a manner which would result in a barrier to the recreational use of a major portion of a community's shore should be avoided as much as practicable.

Among the types of water dependent recreation, provision of adequate boating services to meet future demand is to be encouraged by this Program. The siting of boating facilities must be consistent with preservation and enhancement of other coastal resources and with their capacity to accommodate demand. The provision of new public boating facilities is essential in meeting this demand, but such public actions should avoid competition with private boating development. Boating facilities will, as appropriate, include parking, park-like surroundings, toilet facilities, and pumpout facilities. Harbors of Refuge are particularly needed along Lake Erie and Lake Ontario. There is a need for a better location pattern of boating facilities to correct problems of overused, insufficient, or improperly sited facilities.

Water-related off-road recreational vehicle use is an acceptable activity; provided no adverse environmental impacts occur. Where adverse environmental impacts will occur, mitigating measures will be implemented, where practicable to minimize such adverse impacts. If acceptable mitigation is not practicable, prohibition of the use by off-road recreational vehicles will be posted and enforced. Ground water contamination presents a threat to Fire Island National Seashore water resources.

B. State Means for Implementing the Policy

1. General Functions, Powers and Duties, Parks and Recreation Law (Title B, Article 3, Section 3.09)

This statute authorizes the NYS Office of Parks, Recreation and Historic Preservation (OPRHP) to acquire, establish, operate, and maintain state parks, parkways, historic sites, and state recreational facilities. This Law is employed by the Office to implement the State Comprehensive Recreation Plan (SCRCP) and funding priority system described below.

2. Statewide Park and Recreation Plan, Parks and Recreation Law (Title B, Article 3, Section 3.15)

The State Comprehensive Recreation Plan has a priority system to allocate funding for public parks and outdoor recreation acquisition, development and rehabilitation projects under available State and federal grant assistance funds and State Environmental Quality Bond Act monies. One of the positive rated allocation factors is the degree to which the project contributes to the implementation of the State Comprehensive Recreation Plan or other State, national or regional plans. Thus, the Coastal Management program would require that projects proposed for coastal areas to be evaluated positively under this Priority System if they are water-related or negatively if they are not water-related. The DOS will work with the OPRHP in a review of the State Comprehensive Recreation Plan to ensure that it assigns priority to water-related recreational facilities and activities within the coastal area.

3. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Article 42, Section 919 provides: (1) that all State agency actions, including funding, planning, land transaction, as well as direct development activities must be consistent with the policies of this law which call for the encouragement and facilitation of public access to the shore for recreation, recreational fishing, maintaining open space, and in general, the beneficial use of coastal resources, particularly for recreation whenever appropriate. This provision of law is implemented by amendments to SEQR (cf. 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies' certify that the action is consistent with the coastal policies, one of which is: "Water dependent and water enhanced recreational activities shall be encouraged and facilitated and shall be given priority over non-water related uses along the coast, provided it is consistent with the preservation land enhancement of other coastal resources and takes into account demand for such facilities. In facilitating such activities, priority shall be given to areas where access to the recreation opportunities of the coast can be provided by new or existing public transportation services and to those areas where the use of the shore is severely restricted by existing development." (2) that the Secretary of State review actions of State agencies that would affect achievement of the policies of the law; and (3) that SEMI regulations be amended to require consideration of impacts on the use of coastal resources for recreation.

Section 2 of the law requires State agencies to analyze their programs' consistency with coastal policies and that the Secretary of State reviews such analyses and make recommendations to the Governor and Legislature for any needed changes. The formula for allocating funding to localities and the State Comprehensive Recreation Plan are among the programs that will be analyzed.

4. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
 Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. In assessing the significance of an action's impact on the environment, the impacts on open space and future recreational opportunities are among those considered. The SEQR regulations (NYCRR 617.12) set a much lower threshold for triggering an environmental assessment for an action in or near a recreation area. In addition, as Article 42 of the Executive Law, requires SEQR regulations are being amended to require the consideration of impacts on the use of coastal resources, such as potential recreational use of coastal resources. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8). In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: "Water dependent and water enhanced recreation shall be encouraged and facilitated and shall be given priority over non water-related uses along the coast, provided it is consistent with the preservation and enhancement of other coastal resources and takes into account demand for such facilities. In facilitating such activities, priority shall be given to areas where access to recreation opportunities of the coast can be provided by new or existing public transportation services and to those areas where the use of the shore is severely restricted by existing development."

5. Hudson-Mohawk Urban Cultural Park, Parks and Recreation Law (Title C, Article 13, Section 13.27)
 This Law has resulted in the formulation of a plan for the creation of a statewide system of urban cultural parks, many located within the coastal boundary and which include, among other areas of concern, consideration or urban waterways and other natural areas that offer active and passive recreational opportunities.

6. Statewide Trails System Comprehensive Plan, Parks and Recreation Law (Title B, Article 3, Section 3.09, Subdivision 7-a)
 Where railroad property in coastal areas has been abandoned for railroad transportation purposes, the potential is high for conversion of the right-of-way to recreational use and for increasing access to the land shoreward from the railroad. This provision of the Parks and Recreation Law gives the Commissioner of the Office of Parks, Recreation and Historic Preservation the power to purchase and improve such abandoned railroad rights-of-way as can be used to implement a comprehensive plan for the establishment of a statewide trails system.

7. Acquisition of Abandoned Railroad Transportation Property, Transportation Law (Article 2, Section 18)
 This section of the Transportation Law gives the Commissioner of Transportation the preferential right to acquire abandoned railroads, or to authorize other appropriate State

agencies; metropolitan or regional transportation authorities, or counties, cities, towns and villages to exercise a preferential acquisition right to such abandoned property. The Department of Transportation is required to notify all interested State agencies of the availability of abandoned railway rights-of-way. This Law contains a consistency provision stating that the actions of the Department of Transportation in determining preferential rights to rights-of-way, where a conflict over use exists between one or more government agencies, shall be consistent to the extent practicable with the effectuation of all State plans, policies, and objectives. This provision fits well with the State consistency provisions of the Executive Article 42.

8. Multi-Use Areas Adjacent to and Recreational, Natural and Scenic Areas Along State Highways, Highway Law (Article 2, Section 22)

Recreational, scenic, and natural areas located adjacent to coastal highways enhance not only the setting of a highway, but can provide access to coastal areas that would otherwise be cut off by the highway. This section of the Highway Law can provide for such areas because the Commissioner of the State Department of Transportation is authorized to acquire property for multi-use areas adjacent to State highways, as well as recreational, natural, and scenic areas along, but not necessarily contiguous to, such highways. Multi-use areas can be used for such purposes as walking, hiking, bicycling, trail biking, and for snowmobile trails. Acquisition and development of such areas must be consistent with the coastal policies of Article 42, Executive Law.

9. Harbors of Refuge, Navigation Law (Article 11, Section 141)

This law authorizes the Office of Parks, Recreation and Historic Preservation to enter into agreement with the federal government and with municipalities to construct, operate, and maintain such harbors. Priorities for locating harbors of refuge are determined by the State Comprehensive Recreation Plan Priority System. It is particularly important that the location of such harbors be consistent with the preservation and enhancement of coastal resources so that resource use conflicts are avoided.

10. Local Marine Facilities, Navigation Law (Article 11, Section 142)

Municipalities can help meet the demand for marinas by participating in this program which authorizes State financial assistance to municipalities in the construction of local marine facilities, including those incidental to a harbor of refuge. Priorities for giving financial assistance to municipalities are determined by the State Comprehensive Recreation Plan Priority System.

11. State Marine Facilities, Navigation Law (Article 11, Section 143)

This section of the Navigation Law authorizes the State to construct, operate, and maintain State marine facilities, including that incidental to a harbor of refuge. Priorities for location of these facilities are also determined by the State Comprehensive Recreation Plan Priority System.

12. Environmental Protection Act, Environmental Conservation Law (Article 54)

13. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)

14. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
15. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
16. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
17. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
18. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 22

Development when located adjacent to the shore will provide for water-related recreation whenever such use is compatible with reasonably anticipated demand for such activities, and is compatible with the primary purpose of the development.

A. Explanation of Policy

Many developments present practical opportunities for providing recreation facilities as an additional use of the site or facility. Therefore whenever developments are located adjacent to the shore they should to the fullest extent permitted by existing law provide for some form of water-related recreation use unless there are compelling reasons why any form of such recreation would not be compatible with the development, or a reasonable demand for public use cannot be foreseen.

The types of development which can generally provide water-related recreation as a multiple-use include but are not limited to:

- parks
- highways
- power plants
- utility transmission rights of way
- sewage treatment facilities
- mental health facilities*
- hospitals*
- prisons*
- schools, universities*
- military facilities*
- nature preserves*
- large residential subdivisions (50 units)
- shopping centers
- office buildings

** the types of recreation uses likely to be compatible with these facilities are limited to the more passive forms, such as trails or fishing access. In some cases, land areas not directly or immediately needed by the facility could be used for recreation.*

Prior to taking action relative to any development, State agencies should consult with the State Office of Parks, Recreation, and Historic Preservation, and if there is an approved local waterfront program, with the municipality in which the development is to locate, to determine appropriate

recreation uses. The agency should provide OPRHP and the municipality with the opportunity to participate in project planning.

Appropriate recreation uses which do not require any substantial additional construction shall be provided at the expense of the project sponsor provided the cost does not exceed 2% of total project cost.

In determining whether compelling reasons exist which would make inadvisable recreation as a multiple use, safety considerations should reflect recognition that some risk is acceptable in the use of recreational facilities.

Whenever a proposed development would be consistent with CMP policies and the development could, through the provision of recreation and other multiple uses, significantly increase public use of the shore, then such development should be encouraged to locate adjacent to the shore (this situation would generally only apply within the more developed portions of urban areas).

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires that State agencies actions, including funding, planning, land transactions, as well as direct development activities, must be consistent with the policies of this Act. These policies call for increased public access to the shore for recreation purposes. The Act therefore makes it incumbent on all State agencies to promote water-related recreation whenever there is an opportunity to do so. This provision of law is implemented by amendments to SEQR (see 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Developments when located adjacent to the shore shall provide for water-related recreation whenever appropriate in light of reasonably anticipated demand for such activities and the primary use of such land." Further, this Act requires review by the Secretary of State of State agency actions which may affect achievement of coastal policies. In addition SEQR regulations will be amended to require consideration of impacts on the use of coastal resources for such purposes as recreation.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant effect on the environment. In assessing the significance of an action's impact on the environment, the impacts on open space and future recreational opportunities are considered. Article 42 of the Executive Law requires that SEQR regulations be amended to require the consideration of impacts on the use of coastal resources for such activities as recreation. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations, minimize or avoid, to

the maximum extent practicable the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8). In addition, pursuant to Article 42 of the Executive Law SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Developments when located adjacent to the shore shall provide for water-related recreation whenever appropriate in light of reasonably anticipated demand for such activities and the primary use of such land.”

3. Utility Transmission Facility Siting (Commission Opinion 72-3, Case #26108)

Transmission line rights-of-way are often suitable for recreational activities such as hiking, cycling, cross-country skiing or horseback riding. Many transmission lines are located in coastal areas. Under this Commission opinion, a utility company is required to allocate an amount equal to two percent of the total construction cost of the transmission facility to a fund for the recreational development of the right-of-way. The program applies to electric transmission lines of 115KV ten miles or more in length, or for higher voltage lines of one mile or more. Municipalities traversed by any part of the right-of-way, as well as State and federal agencies, are eligible to use the fund, which provides fifty percent of the cost of any particular recreational development. The sponsor must pay the rest of the cost. The Public Service Commission policy relating to actual recreational development of a specific right-of-way is decided on a case-by-case basis. It is not an automatic part of every order issued by the Commission in connection with transmission line decisions. At the present time, the joint funding of recreational development for rights-of-way is not being acted upon because of research that is underway in connection with health and safety effects that may be associated with high-voltage transmission facilities.

4. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)

Article 10 for the siting of new facilities replaces Public Service Law Article X, which expired on January 1, 2003, but is still valid for facilities licensed pursuant to it. Article 10 captures the review of the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. Siting review of new and repowered or modified major electric generating facilities in New York State is by the Board on Electric Generation Siting and the Environment (Siting Board) using a unified proceeding instead of requiring numerous state and local permits. The law requires environmental and public health impact analyses, studies regarding environmental justice and public safety, and consideration of local laws. Article 10 also requires a utility security plan reviewed by Homeland Security.

5. Multi-Use Areas Adjacent to and Recreational, Natural, and Scenic Areas Along State Highways, Highway Law (Article 2, Section 22)

Areas adjacent to highways in the coastal area can provide numerous opportunities for multi-use recreation. This part of the Highway Law authorizes the Department of Transportation to acquire property adjacent to State highways for multi-use recreational purposes and along, but not necessary contiguous to, State highways for recreational,

natural and scenic purposes. Multi-use areas may be utilized for, but not limited to, hiking, bicycle, trail bike, recreational vehicle and snowmobile trails.

6. Development of Transportation Corridors; Multiple Use Outside the Counties of Kings and Queens of Right of Way, Transportation Law (Article 2, Section 14-E)
All transportation facilities, especially those in coastal areas, have the potential for development of multi-use activities, including recreation, in their rights-of-way.
This article of the Transportation Law gives the Commissioner of the Department of Transportation the power to provide for the multi-use of transportation facility rights-of-way in conjunction with the construction of such facilities. This applies everywhere in the state except in Kings and Queens Counties.
7. Power to Acquire Reforestation Areas; Prohibition Against Compensation or Gratuity, Environmental Conservation Law (Article 9, Title 5, Section 0501)
Numerous coastal recreational activities are compatible with reforestation and forest management. This law gives the Department of Environmental Conservation the power to acquire lands for reforestation and for establishment and maintenance of forests for watershed protection, timber production and other forest products, and for recreation and other purposes. The reforestation areas must consist of at least five hundred acres of contiguous lands.
8. Environmental Protection Act, Environmental Conservation Law (Article 54)
9. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
10. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
11. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
12. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
13. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
14. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
15. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6, Chapter IV, Subchapter H, Part 487)
16. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 23

Protect, enhance and restore structures, districts, areas or sites that are of significance in the history, architecture, archeology or culture of the State, its communities, or the Nation.

A. Explanation of Policy

Among the most valuable of the State's human-made resources are those structures on areas which are of historic, archeological, or cultural significance. The protection of these structures must involve recognition of their importance by all agencies and the ability to identify and describe them. Protection must include concern not just with specific sites but with areas of significance, and with the area around specific sites. The policy is not to be construed as a passive mandate but must include active efforts when appropriate to restore or revitalize through adaptive reuse. While the program is concerned with the preservation of all such resources within the coastal boundary, it will actively promote the preservation of historic and cultural resources which have a coastal relationship.

The structures, districts, areas or sites that are of significance in the history, architecture, archeology or culture of the State, its communities, or the Nation comprise the following resources:

- (a) A resource which is in a federal or State park established, among other reasons, to protect and preserve the resource.
- (b) A resource on, nominated to be on, or determined eligible to be on the National or State Registers of Historic Places.
- (c) A resource on or nominated to be on the State Nature and Historical Preserve Trust.
- (d) An archeological resource which is on the State Department of Education's inventory of archeological sites.
- (e) A local landmark, park, or locally designated historic district that is located within the boundary of an approved local waterfront revitalization program.
- (f) A resource that is a significant component of an Urban Cultural Park.

All practicable means to protect structures, districts, areas or sites that are of significance in the history, architecture, archeology or culture of the State, its communities or the Nation shall be deemed to include the consideration and adoption of any techniques, measures, or controls to prevent a significant adverse change to such significant structures, districts, areas or sites. A significant adverse change includes but is not limited to:

- (a) Alteration of or addition to one or more of the architectural, structural, ornamental or functional features of a building, structure, or site that is a recognized historic, cultural, or archeological resource, or component thereof. Such features are defined as encompassing the style and general arrangement of the exterior of a structure and any original or historically significant interior features including type, color and texture of building materials; entry ways and doors; fenestration; lighting fixtures; roofing; sculpture and carving; steps; rails; fencing; windows; vents and other openings; grillwork; signs; canopies; and other appurtenant fixtures and, in addition, all buildings, structures, outbuildings, walks, fences, steps, topographical features, earthworks, paving and signs located on the designated resource property. (To the extent they are relevant, the Secretary of the Interior's "Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings" shall be adhered to.)

- (b) Demolition or removal in full or part of a building, structure, or earthworks that is a recognized historic, cultural, or archeological resource or component thereof, to include all those features described in (a) above plus any other appurtenant fixture associated with a building structure or earthwork.
- (c) All proposed actions within 500 feet of the perimeter of the property boundary of the historic, architectural, cultural, or archeological resource and all actions within an historic district that would be incompatible with the objective of preserving the quality and integrity of the resource. Primary considerations to be used in making judgment about compatibility should focus on the visual and location relationship between the proposed action and the special character of the historic, cultural, or archeological resource. Compatibility between the proposed action and the resource means that the general appearance of the resource should be reflected in the architectural style, design material, scale, proportion, composition, mass, line, color, texture, detail, setback, landscaping and related items of the proposed actions: With historic districts this would include infrastructure improvements or changes, such as, street and sidewalk paving, street furniture and lighting.

This policy shall not be construed to prevent the construction, reconstruction, alteration, or demolition of any building, structure, earthwork, or component thereof of a recognized historic, cultural or archeological resource which has been officially certified as being imminently dangerous to life or public health. Nor shall the policy be construed to prevent the ordinary maintenance, repair, or proper restoration according to the U.S. Department of Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings of any building, structure, site or earthwork, or component thereof of a recognized historic, cultural or archeological resource which does not involve a significant adverse change to the resource, as defined above.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways; Executive Law (Article 42)
Article 42, Section 919 requires: 1) that all State agency actions including funding, planning, land transactions, as well as direct development activities must be consistent with the policies of this Act. One of these policies calls for restoration and revitalization of natural and human-made resources; elsewhere the Legislature has determined that among most important human-made resources of the State are its historical, architectural, archeological, and cultural assets;⁵¹ this provision of the law will be implemented through amendments to SEQR regulations (see 2 below) and the regulations issued pursuant to Article 14 of the Parks and Recreation Law (see 3 below), and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: "Protect, enhance and restore structures, districts, areas or sites that are of significance in the history, architecture, archaeology, or culture of the State, its communities, or the Nation." 2) that the Secretary of State may review actions of State agencies that may affect achievement of the policies of the Act; and 3) that SEQR regulations be amended to, among other things, require consideration of the effects of an

action on the use and conservation of coastal re-sources, such as the historical, architectural, archeological, and cultural resources of the coastal area.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
 Under this Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. In determining whether an action may have a significant effect on the environment, impairment of the character or quality of important historical, archeological, architectural, or of community or neighborhood character are to be considered as indicators of such significant effects. The SEQR regulations set a very low threshold for triggering an environmental assessment “any action (unless the action is designed for the preservation of the facility or site) occurring wholly or partially within, or contiguous to any facility or site listed on the National Register of Historic Places, or any historic building, structure, or site, or prehistoric site that has been proposed by the Committee on the Registers for consideration by the NYS Board on Historic Preservation for a recommendation to the State Historic Officer for nomination for inclusion in said National Register”. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement. In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Protect, enhance and restore structures, districts, areas, or sites that are of significance in the history, architecture, archeology, or culture of the State, its communities, or the Nation.”

3. New York State Historic Preservation Act of 1980 (State Board for Historic Preservation, Parks and Recreation Law (Title B, Article 11, Section 11.03); Powers, Functions and Duties, Parks and Recreation Law (Title B, Article 11, Section 11.09); Historic Preservation, Parks and Recreation Law (Title C, Article 14); Historic and Cultural Properties, Public Buildings Law (Article 4-B); Historic Preservation, General Municipal Law (Article 5-K))

The New York State Historic Preservation Act greatly expands the responsibilities of New York State agencies and municipalities with regard to historic preservation. Specifically, the Act provides several means for preserving the historic architectural, archeological, and cultural resources of the State, (including resources under water). Each State agency must designate a historic preservation officer to coordinate and implement State historic preservation programs. A State Register of Historic Places is created and an inventory of properties which may qualify for the Register is established. A Statewide Preservation Plan is to be prepared and updated annually. A review process has been established, to be undertaken concurrently with existing environmental reviews; this process requires State agencies to consult with the Commissioner of Parks, Recreation and Historic Preservation if a State-funded project will have an adverse effect upon a historic property. The review process requires consideration of alternatives, and that adverse effects be avoided or mitigated. The Secretary of State is added to State Board for Historic Preservation, and the

Commissioner of the Office of General Services is required to consider the use and restoration of historic buildings in meeting the State's needs for building space.

4. State Nature and Historical Preserve Trust, Environmental Conservation Law (Article 45)
This program provides for the acquisition and administration of lands and waters which should be preserved for their historical significance, among other purposes. The Environmental Quality Bond Act of 1972 (Environmental Conservation Law Article 51, Title 7, Section 0701) is the current source of State funds to acquire lands under this program.
5. Environmental protection Act, Environmental Conservation Law (Article 54)
6. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
8. New York State Scenic Byways Program, Highway Law (Article 12-C)
9. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
10. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
11. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
12. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 24

Prevent impairment of scenic resources of statewide significance.

A. Explanation of Policy

The Coastal Management Program will identify on the coastal area map scenic resources of statewide significance. A list of preliminarily identified resources appears in the Appendix. The following general criteria will be combined to determine significance:

Quality - The basic elements of design (i.e., two-dimensional line, three-dimensional form, texture and color) combine to create all high quality landscapes. The water, landforms, and human-made components of scenic coastal landscapes exhibit variety of line, form, texture and color. This variety is not, however, so great as to be chaotic. Scenic coastal landscapes also exhibit unity of components. This unity is not, however, so complete as to be monotonous. Example: the Thousand Islands where the mix of water, land, vegetative and human-made components creates interesting variety, while the organization of these same components creates satisfying unity.

Often, high quality landscapes contain striking contrasts between lines, forms, textures and colors. Example: A waterfall where horizontal and vertical lines and smooth and turbulent textures meet in dramatic juxtaposition.

Finally, high quality landscapes are generally free of discordant features, such as structures or other elements which are inappropriate in terms of siting, form, scale, and/or materials.

Uniqueness - The uniqueness of high quality landscapes is determined by the frequency of occurrence of similar resources in a region of the State or beyond.

Public Accessibility - A scenic resource of significance must be visually and, where appropriate, physically accessible to the public.

Public Recognition - Widespread recognition of a scenic resource is not a characteristic intrinsic to the resource. It does, however, demonstrate people's appreciation of the resource for its visual, as well as evocative, qualities. Public recognition serves to reinforce analytic conclusions about the significance of a resource.

When considering a proposed action, agencies shall first determine whether the action could affect a scenic resource of statewide significance. This determination would involve: 1) a review of the coastal area map to ascertain if it shows an identified scenic resource which could be affected by the proposed action, and 2) a review of the types of activities proposed to determine if they would be likely to impair the scenic beauty of an identified resource. Impairment will include: (i) the irreversible modification of geologic forms; the destruction or removal of vegetation; the modification, destruction, or removal of structures, whenever the geologic forms, vegetation or structures are significant to the scenic quality of an identified resource; and (ii) the addition of structures which because of siting or scale will reduce identified views or which because of scale, form, or materials will diminish the scenic quality of an identified resource.

The following siting and facility-related guidelines are to be used to achieve this policy, recognizing that each development situation is unique and that the guidelines will have to be applied accordingly. Guidelines include:

- siting structures and other development such as highways, power lines, and signs, back from shorelines or in other inconspicuous locations to maintain the attractive quality of the shoreline and to retain views to and from the shore;
- clustering or orienting structures to retain views, save open space and provide visual organization to a development;
- incorporating sound, existing structures (especially historic buildings) into the overall development scheme;
- removing deteriorated and/or degrading elements;
- maintaining or restoring the original land form, except when changes screen unattractive elements and/or add appropriate interest;
- maintaining or adding vegetation to provide interest, encourage the presence of wildlife, blend structures into the site, and obscure unattractive elements, except when selective

clearing removes unsightly, diseased or hazardous vegetation and when selective clearing creates views of coastal waters;

- using appropriate materials, in addition to vegetation, to screen unattractive elements;
- using appropriate scales, forms and materials to ensure that buildings and other structures are compatible with and add interest to the landscape.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for preventing impairment of scenic beauty. This provision of law is implemented by amendments to SEQR (cf. 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600), provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Prevent impairment of scenic resources of statewide significance, as identified on the coastal area map. Impairment shall include: (i) the irreversible modification of geological forms; destruction or removal of vegetation; modification, destruction or removal of structures, whenever the geologic forms, vegetation, or structures are significant to the scenic quality of an identified resource and (ii) the addition of structures which because of siting or scale will reduce identified views or which because of scale, form, or materials will diminish the scenic quality of an identified resource.” 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and 3) that SEQR regulations be amended to reflect consideration of coastal resources such as scenic resources.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. The environment is broadly defined to include existing patterns of development and land resources; hence scenic areas are viewed as an environmental resource. The SEQR regulations (6 NYCRR Part 617) require that actions which have been subject to an environmental impact statement must, consistent with social, economic and other essential considerations, minimize or avoid, to the maximum extent practicable, the adverse effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8).

In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Prevent impairment of scenic resources of statewide significance, as identified on the coastal area map. Impairment shall include: (i) the irreversible modification of geological forms; destruction or removal of vegetation; modification, destruction or removal of structures, whenever the geologic forms, vegetation or structures are significant to the scenic quality of an identified

resource and (ii) the addition of structures which because of siting or scale will reduce identified views or which because of scale, form, or materials will diminish the scenic quality of an identified resource.”

3. General Functions, Powers and Duties of the Department (Protection of Natural and Man-Made Beauty), Environmental Conservation Law (Article 49, Title 1, Section 0103, Subdivisions 1 and 4)
Under these two parts of the law, DEC has the power and duty to: (1) develop policies and programs to preserve and enhance the natural and human-made beauty of the State and (2) “designate scenic sites, areas and highways in the State and develop programs for their preservation and enhancement.” Where such programs exist for areas in the coastal zone, they can be used as a guide for determining the consistency of proposed actions with coastal policy. The Coastal Management Program will work closely with DEC to designate additional sites and develop programs for their protection.
4. State Nature and Historical Preserve Trust, Environmental Conservation Law (Article 45)
The Trust provides for the acquisition and administration of lands and waters which should be preserved for their natural beauty. Scenic resources of particular significance in the coastal area would, thus, be eligible for acquisition. The Environmental Quality Bond Act of 1972 (Environmental Conservation Law Article 51, Title 7, Section 0701) is the major state funding mechanism to implement this acquisition program.
5. Siting of Major Utility Transmission Facilities, Public Service Law (Article VII) and Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
6. Tidal Wetlands Act, Environmental Conservation Law (Article 25)
The issuance of permits for regulated uses or activities in tidal wetlands requires that the preservation and protection of aesthetic resources be considered. 6 NYCRR, Part GG 1.10, specifically includes aesthetic considerations among the permit issuing standards.
7. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
The preservation and protection of aesthetic resources is one of the objectives of this act. The regulations require the consideration of aesthetics in the issuance of a permit.
8. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
While the purpose of this law is not to protect the quality of coastal scenery, those natural protective features (dunes, beaches, spits, barrier islands, bluffs) which the act protects are major components of coastal scenery.
9. Environmental Protection Act, Environmental Conservation Law (Article 54)
10. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
11. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
12. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
13. New York State Scenic Byways Program, Highway Law (Article 12-C)

14. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
15. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
16. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
18. Regulations Implementing Article VII of the Public Service Law (New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter F, Part 84 Transmission Facilities Management; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 85 General Procedures; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 86 General Exhibits; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 87 Exhibits for Gas Transmission; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 88 Exhibits for Electric Transmission Filings; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter H, Part 89 Notification Requirements)

POLICY 25

Protect, restore or enhance natural and man-made resources which are not identified as being of statewide significance, but which contribute to the overall scenic quality of the coastal area.

A. Explanation of Policy

When considering a proposed action, which would not affect a scenic resource of statewide significance, agencies shall undertake to ensure that the action would be undertaken so as to protect, restore or enhance the overall scenic quality of the coastal area. Activities which could impair or further degrade scenic quality are the same as those cited under the previous policy, i.e., modification of natural landforms, removal of vegetation, etc. However, the effects of these activities would not be considered as serious for the general coastal area as for significant scenic areas.

The siting and design guidelines listed under the previous policy should be considered for proposed actions in the general coastal area. More emphasis may need to be placed on removal of existing elements, especially those which degrade, and on addition of new elements or other changes which enhance. Removal of vegetation at key points to improve visual access to coastal waters is one such change which might be expected to enhance scenic quality.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
Section 919 of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for preventing impairment of scenic beauty. This provision of law is implemented by amendments to SEQRA (cf. 2 below) and by DOS

regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Protect, restore or enhance natural and human-made resources which are not identified as being of statewide significance, but which contribute to the overall scenic quality of the coastal area.” 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and 3) that SEQR regulations be amended to reflect consideration of coastal resources such as scenic resources.

Section 2 of the law requires that State agencies analyze their programs consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. The environment is broadly defined to include existing patterns of development and land resources; hence actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations, minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8). In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Protect, restore or enhance natural and [human-made] resources which are not identified as being of statewide significance, but which contribute to the overall scenic quality of the coastal area.”
3. Tidal Wetlands Act, Environmental Conservation Law (Article 25)
4. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
5. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
8. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
9. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
10. New York State Scenic Byways Program, Highway Law (Article 12-C)
11. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
12. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
13. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 26**Conserve and protect agricultural lands in the State's coastal area.****A. Explanation of Policy**

The first step in conserving agricultural lands is the identification of such lands. The Department of State is mapping all important agricultural lands within the State's coastal area. The following criteria have been used to prepare the maps, and the mapped information will be incorporated in the New York State Coastal Resources Inventory and on the Coastal Area Map.

Land meeting any of the following criteria is being mapped.⁵²

1. Land which meets the definition of the U.S. Department of Agriculture as being prime farmland, unique farmland, or farmland of statewide importance.
 - a. Prime farmland is defined by USDA Soil Conservation Service in CRF #7 Agriculture Part 651.5(a), January, 1979. A list of the soil associations that meet this definition has been prepared for each coastal county.⁵³
 - b. Unique farmland is defined by USDASCS in CRF #7 Agriculture Part 657.5(b). In the coastal area of New York all fruit and vegetable farming meets the terms of the definition.
 - c. Farmland of Statewide importance is defined by USDASCS in CRF #7 Agriculture Part 656.5(c). Lists of soil associations which constitute farmland of statewide importance have been prepared for each coastal county.
2. Active farmland within Agricultural Districts. The maps of each Agricultural District show land committed by farmers. This is the land that will be mapped as active farmland. The district boundary will also be shown.
3. Areas identified as having high economic viability for farming. Any farm not identified in 1 and/or 2 above and which is located in an area identified as having "high viability" on the map entitled "Economic Viability of Farm Areas" prepared by the Office of Planning Coordination in May, 1969. This would be the basis for initial identification of areas having high economic viability for farming. Areas will be added and/or deleted based on comments from the agricultural community.
4. Areas adjacent to land identified in 1 above if these areas are being farmed and are part of a farm with identified important agricultural lands.
5. Prime farmland, unique farmland, and farmland of statewide significance will not be identified as important agricultural land whenever it occurs as parcels of land less than 25 acres in size and these small parcels are not within a mile of areas of active farming.

Given the Program's application to a narrow strip of land, implementing a policy of promoting agricultural use of land must, to be practical, concentrate on controlling the replacement of agricultural land uses with non-agricultural land use as the result of some public action. The

many other factors such as markets, taxes, and regulations, which influence the viability of agriculture in a given area, can only be addressed on a Statewide or national basis.

The Program policy requires a concern for the loss of any important agricultural land. However, the primary concern must be with the loss of agricultural land when that loss would have a significant effect on an agricultural area's ability to continue to exist, to prosper, and even to expand. A series of determinations are necessary to establish whether a public action is consistent with the conservation and protection of agricultural lands or whether it is likely to be harmful to the health of an agricultural area. In brief these determinations are as follows: First, it must be determined whether a proposed public action would result in the loss of important agricultural lands as mapped on the Coastal Inventory. If it would not result, either directly or indirectly, in the loss of identified important agricultural lands, then the action is consistent with the policy on agriculture. If it is determined that the action would result in a loss of identified important agricultural lands but that loss would not have an adverse effect on the viability of agriculture in the surrounding area, then the action may also be consistent with the agriculture policy. However, in that case the action must be undertaken in a manner that would minimize the loss of important farmland. If the action is determined to result in a significant loss of important agricultural land, that is, if the loss is to a degree sufficient to adversely affect surrounding agriculture's viability, its ability to continue to exist, to prosper, and even to expand, then the action is not consistent with this agriculture policy.

The following guidelines define more fully what must be considered in making the above determinations:

- A. A public action would be likely to significantly impair the viability of an agricultural area in which identified important agricultural lands are located if:
 1. the action would occur on identified important agricultural lands and would:
 - a. consume more than 10% of the land of an active farm⁵⁴ containing such identified important agricultural lands
 - b. consume a total of 100 acres or more of identified important agricultural land, or
 - c. divide an active farm with identified important agricultural land into two or more parts thus impeding efficient farm operation
 2. the action would result in environmental changes which may reduce the productivity or adversely affect the quality of the product of any identified important agricultural lands.
 3. the action would create real estate market conditions favorable to the conversion of large areas of identified important agricultural lands to non-agricultural uses. Such conditions may be created by:
 - a. public water or sewer facilities to serve non-farm structures
 - b. transportation improvements, except for maintenance of, and safety improvements to, existing facilities that serve non-farm or non-farm related development

- c. major non-agribusiness commercial development adjacent to identified agricultural lands
 - d. major public institutions
 - e. residential uses other than farm dwellings.
 - f. any change in land use regulations applying to agricultural land which would encourage or allow uses incompatible with the agricultural use of the land
- B. The following types of facilities and activities should not be construed as having adverse effects on the preservation of agricultural land
- 1. Farm dwellings, barns, silos, and other accessory uses and structures incidental to agricultural production or necessary for farm family supplemental income.
 - 2. Agribusiness development which includes the entire structure of local support services and commercial enterprises necessary to maintain an agricultural operation, e.g., milk hauler, grain dealer, farm machinery dealer, veterinarian, food processing plants.
- C. In determining whether an action that would result in the loss of farmland is of overriding regional or statewide benefit, the following factors should be considered:
- 1. For an action to be considered overriding it must be shown to provide significantly greater benefits to the region or State than are provided by the affected agricultural area (not merely the land directly affected by the action). In determining the benefits of the affected agriculture to the region or State, consideration must be given to its social and cultural value, its economic viability, its environmental benefits, its existing and potential contribution to food or fiber production in the State and any State food policy, as well as its direct economic benefits.
 - a. An agricultural area is an area predominantly in farming and in which the farms produce similar products and/or rely on the same agribusiness support services and are to a significant degree economically interdependent. At a minimum this area should consist of at least 500 acres of identified important agriculture land. For the purpose of analyzing impacts of any action on agriculture, the boundary of such area need not be restricted to land within the coastal boundary. If the affected agricultural lands lie within an agricultural district then, at a minimum, the agricultural area should include the entire agricultural district.
 - b. In determining the benefits of an agricultural area, its relationship to agricultural lands outside the area should also be considered.
 - c. The estimate of the economic viability of the affected agricultural area should be based on an assessment of

- i. soil resources, topography, conditions of climate and water resources
 - ii. availability of agribusiness and other support services, and the level and condition of investments in farm real estate, livestock and equipment
 - iii. the level of farming skills as evidenced by income obtained, yield estimates for crops, and costs being experienced with the present types and conditions of buildings, equipment, and cropland.
 - iv. use of new technology and the rates at which new technology is adopted
 - v. competition from substitute products and other farming regions and trends in total demand for given products
 - vi. patterns of farm ownership for their effect on farm efficiency and the likelihood that farms will remain in use
- d. The estimate of the social and cultural value of farming in the area should be based on an analysis of:
- i. the history of farming in the area
 - ii. the length of time farms have remained in one family
 - iii. the degree to which farmers in the area share a cultural or ethnic heritage
 - iv. the extent to which products are sold and consumed locally
 - v. the degree to which a specific crop(s) has become identified with a community
- e. An estimate of the environmental benefits of the affected agriculture should be based on analysis of:
- i. the extent to which the affected agriculture as currently practiced provides a habitat or food for wildlife
 - ii. the extent to which a farm landscape adds to the visual quality of an area
 - iii. any regional or local open space plans, and degree to which the open space contributes to air quality
 - iv. the degree to which the affected agriculture does, or could, contribute to the establishment of a clear edge between rural and urban development
- D. Whenever a proposed action is determined to have an insignificant adverse effect on identified important agricultural land or whenever it is permitted to substantially hinder

the achievement of the policy according to DOS regulations, Part 600, or as a result of the findings of an EIS, then the required minimization should be under-taken in the following manner:

1. The proposed action shall, to the extent practicable, be sited on any land not identified as important agricultural, or, if it must be sited on identified important agricultural land, sited to avoid classes of agricultural land according to the following priority:
 - a. prime farmland in orchards or vineyards
 - b. unique farmland in orchard or vineyards
 - c. other prime farmland in active farming
 - d. other unique farmland
 - e. farmland of statewide importance in active farming
 - f. active farmland identified as having high economic viability
 - g. prime farmland not being farmed
 - h. farmland of statewide importance not being farmed
2. To the extent practicable, agricultural use of identified important agricultural land not directly necessary for the operation of the proposed non-agricultural action should be provided for through such means as lease arrangements with farmers, direct undertaking of agriculture, or sale of surplus land to farmers. Agricultural use of such land shall have priority over any other proposed multiple use of the land.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, one of which calls for the conservation and protection of agricultural lands. This provision of law is implemented by amendments to SEQR (cf. 2 below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: To conserve and protect agricultural lands in the State's coastal area, an action shall not result in a loss or impair the productivity of important agricultural land, as identified on the coastal area map, if that loss or impairment would adversely affect the value of agriculture in an agricultural district or, in the area surrounding such lands, if there is no agriculture district; 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and 3) that SEQR regulations be amended to reflect consideration of coastal resources, such as agricultural lands.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. The environment is broadly defined to include existing patterns of development, and land resources; hence farming and important agricultural lands are viewed as an environmental resource. The SEQR regulation (6 NYCRR Part 617) set a very low threshold for triggering an environmental assessment for actions within agricultural districts. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations, minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8). In addition, pursuant to Article 42 of the Executive Law SEQR regulations are amended to require that for actions by a state agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: To conserve and protect agricultural lands in the State's coastal area, an action shall not result in a loss or impair the productivity of important agricultural land, as identified on the coastal area map, if that loss or impairment would adversely affect the value of agriculture in an agricultural district or, in the area surrounding such lands, if there is no agriculture district.
3. Agricultural District Program, Agriculture and Markets Law (Article 25AA)
The Agricultural District Law provides the primary means for the State to directly pursue a policy of conserving important agricultural lands. Most of the important coastal agricultural land is already included in agricultural districts. The provisions of the law which lead to the conservation of farmland include 1) farm value assessments, (recent amendments improve this provision); 2) limitations on the exercise of eminent domain; 3) a requirement that State agencies' regulations encourage maintenance of farming; 4) limitations on local ordinances that adversely affect farming and 5) limitations on the power of public service districts to impose taxes. These provisions, plus the power given the State to create such districts where it would further state environmental plans, policies or objectives, constitute the basic state program for conserving all important farmland.
4. Preservation of Agricultural Lands, Public Park and Recreational Lands, Wildlife and Waterfowl Refuges and Historical Sites, Transportation Law (Article 2, Section 14-A)
This law requires that the Commissioner of Transportation cooperate with the Commissioner of Agriculture and Markets to assure that measures to preserve farmland and the natural characteristics of the land traversed by transportation facilities are included in all stages of such projects.
5. Environmental Protection Act, Environmental Conservation Law (Article 54)
6. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)

8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 27

Decisions on the siting and construction of major energy facilities in the coastal area will be based on public energy needs, compatibility of such facilities with the environment, and the facility's need for a shorefront location.

A. Explanation of Policy

New York's overall annual energy demand has begun to flatten over time, in part due to the success of State and utility energy efficiency programs. However, peak load (the highest amount of energy consumption in a given year) has continued to increase at a more rapid pace.⁵⁵ Renewable power sources—hydro, solar, wind, and other carbon-free solutions—also continue to grow as a share of the total energy produced in the State.⁵⁶ Significant investments in the billions of dollars are needed to replace New York's aging electric transmission and distribution infrastructure just to meet currently projected energy demand.⁵⁷ To respond to these significant shifts in the State's energy infrastructure, State energy policies are being designed to maintain energy system reliability during peak load in ways that improve the grid's overall system efficiency, from both energy transmission and capital investment perspectives.⁵⁸

The New York State energy planning process provides a comprehensive framework for improving the State's energy system, addressing issues such as environmental impacts, resiliency, and affordability.⁵⁹ Key areas of focus for New York's energy planning and implementation policies include integration of renewable energy generation; local energy generation that can foster both economic prosperity and environmental stewardship; seeking innovative energy solutions across the State's public facilities and operations; increasing energy efficiency; and decreasing greenhouse gas emissions.^{60, 61} New York's energy policy is also central to how the State responds to the challenges presented by a changing climate. New York State's energy planning recognizes that extreme weather events demand more resilient energy infrastructure, and that climate change presents both challenges and opportunities to lead and innovate.⁶²

A determination of public need for energy is the first step in the process for siting any new facilities. The directives for determining this need are contained primarily in Article 6 of the New York State Energy Law. That Article requires the preparation of a State Energy Plan. With respect to transmission lines and the siting of major electric generating facilities, Articles VII and 10 of the State's Public Service Law require additional forecasts and establish the basis for determining the compatibility of these facilities with the environment and the basis of necessity for providing additional transmission or generation capacity. The policies derived from the siting regulations under these Articles are entirely consistent with the general coastal zone policies derived from other laws, particularly the regulations promulgated pursuant to the Waterfront Revitalization of Coastal Areas and Inland Waterways law. That law is used for the purposes of ensuring consistency with the Coastal Management Program.

The Department of State will present testimony for the record during relevant certification proceedings under Articles VII and 10 of the Public Service Law when appropriate; and use the State SEQR and DOS regulations to ensure that decisions regarding other proposed energy facilities (not subject to Articles VII and 10 of the Public Service Law) that would affect the coastal area are consistent with coastal policies.

B. State Means for Implementing the Policy

1. Energy Planning, Energy Law (Article 6)

New York's State Energy Plan is adopted every four years to set forth a vision to advance the State's energy future in a cost-effective and sustainable manner. The plan is prepared pursuant to Energy Law Article 6 requirements and provides direction to state agencies making decisions concerning energy facility licensing and the location of transmission facilities. Any siting or development of energy facilities or power transmission facilities along the coast must consider State Energy Plan guidelines. Any energy-related action or decision of a state agency, board, commission or authority must be reasonably consistent with the forecasts and the policies and long-range energy planning objectives and strategies contained in the Plan, including its most recent update; provided, however, that any such action or decision which is not reasonably consistent with the Plan will be deemed in compliance, provided that such action or decision includes a finding that the relevant provisions of the Plan are no longer reasonable or probable based on a material and substantial change in fact or circumstance, and a statement explaining the basis for this finding. A state agency, board, commission or authority may take official notice of the most recent State Energy Plan adopted by the Board prior to any final energy-related decision by such agency, board, commission or authority.

2. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)

Article 10 for the siting of new facilities replaces Public Service Law Article X, which expired on January 1, 2003, but is still valid for facilities licensed pursuant to it. Article 10 captures the review of the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. Siting review of new and repowered or modified major electric generating facilities in New York State is by the Board on Electric Generation Siting and the Environment (Siting Board) using a unified proceeding instead of requiring numerous state and local permits. The law requires environmental and public health impact analyses, studies regarding environmental justice and public safety, and consideration of local laws. Article 10 also requires a utility security plan reviewed by Homeland Security.

Before preparation of a site or the construction of a major electric generating facility can commence, a Certificate of Environmental Compatibility and Public Need must be issued by the New York State Board on Electric Generation Siting and the Environment. This process is described in detail in Section 7.

The Board shall not grant a Certificate or amendment for the construction or operation of a facility without making explicit findings regarding the nature of the probable environmental impacts of the construction and operation of the facility, including the cumulative environmental impacts of the construction and operation of related facilities

such as electric lines, gas lines, water supply lines, waste water or other sewage treatment facilities, communications and relay facilities, access roads, rail facilities, or steam lines, including impacts on: ecology, air, ground and surface water, wildlife, and habitat; public health and safety; cultural, historic, and recreational resources, including aesthetics and scenic values; and transportation, communication, utilities and other infrastructure. Such findings shall include the cumulative impact of emissions on the local community including whether the construction and operation of the facility results in a significant and adverse disproportionate environmental impact, in accordance with regulations promulgated by the Department of Environmental Conservation regarding environmental justice issues.

The Board may not grant a Certificate for the construction or operation of a major electric generating facility, either as proposed or as modified by the board, unless the board determines that:

- the facility is a beneficial addition to or substitution for the electric generation capacity of the state; and
- the construction and operation of the facility will serve the public interest; and
- the adverse environmental effects of the construction and operation of the facility will be minimized or avoided to the maximum extent practicable; and,
- if the Board finds that the facility results in or contributes to a significant and adverse disproportionate environmental impact in the community in which the facility would be located, the applicant will avoid, offset or minimize the impacts caused by the facility upon the local community for the duration that the Certificate is issued to the maximum extent practicable using verifiable measures; and
- the facility is designed to operate in compliance with applicable state and local laws and regulations issued concerning the environment, public health and safety. The Board may elect not to apply any local ordinance, law, resolution, regulation or other action, or any local standard or requirement, including those relating to the interconnection to and use of water, electric, sewer, telecommunication, fuel and steam lines in public rights of way, which would be otherwise applicable if the Board finds that the local ordinance, law, resolution, regulation, other action, standard or requirement is unreasonably burdensome in view of the existing technology or the needs of or costs to ratepayers located inside or outside of the municipality. In such cases, the Board is to provide the municipality an opportunity to present evidence in support of such ordinance, law, resolution, regulation or other local action issued.

The regulations which implement Article 10 assure that the Board's decision will be compatible with the policies articulated in this document, both those relating to environmental protection and to economic development.

To further ensure compatibility, the Department of State will review applications and may present testimony during proceedings involving facilities proposed to be sited in the coastal area. When reviewing applications, the Department will examine the alternate locations

proposed by the applicant as well as the rationale for the preferred site, particularly with respect to potential land uses on or near the proposed site, and the justification for the amount of shorefront land to be used. Proposed uses which are likely to be regarded by the Department as requiring a shorefront location include:

- Uses involved in sea/land transfer of goods (docks, pipelines, short term storage facilities);
- Uses requiring large quantities of water (hydroelectric power plants, pumped storage power plants); and,
- Uses that rely heavily on waterborne transportation of raw materials or products which are difficult to transport on land.

Article 10 also provides that the Department of Environmental Conservation may issue permits pursuant to federally delegated authority under the federal Clean Water Act, the federal Clean Air Act, and the federal Resource Conservation and Recovery Act. Any permits issued under these authorities shall be provided to the Board of Electric Generation and Siting prior to the issuance of a certificate.

3. Siting of Major Utility Transmission Facilities, Public Service Law (Article VII)

Prior to the construction of a major electric or fuel gas transmission facility, a Certificate of Environmental Compatibility and Public Need must be granted by the Public Service Commission. See Section 7 of this document for a detailed description of this process. In issuing a certificate, the Commission must determine that the facility:

- Represents the minimum adverse environmental impact, considering the state of available technology and the nature and economics of the various alternatives;
- Conforms with applicable State laws;
- Serves the public interest, convenience and necessity.

As with steam electric generating plants, the Department of State will review applications and may present testimony during proceedings involving transmission facilities proposed to be sited in the coastal area. The Department will examine the same matters as under Article 10. It will also use the same criteria to determine the need for a shore-front location and the consistency of the proposal with coastal policies.

Interstate transmission facilities, such as gas and petroleum pipelines and electric transmission lines associated with hydroelectric facilities, are regulated by federal agencies. Through federal consistency provisions, such facilities will be sited in a manner that is consistent with the Program's policies.

4. Liquefied Natural and Petroleum Gas, Environmental Conservation Law (Article 23, Title 17)

All liquefied natural gas (LNG) and liquefied petroleum gas (LPG) facilities, must obtain an environmental safety permit before construction and operation. For a permit to be granted, it must be shown that such facilities would not endanger residential areas and contiguous populations and would otherwise conform to siting criteria established by the

Department of Environmental Conservation. During the review of proposed projects, consideration is given to: the location of the proposed facility; the design and capacity of the facility; expected sources of the gas; methods of transporting gas to and from the facility and transportation routes; the public need for the facility; its environmental impacts; and, descriptions of reasonable alternate locations for the facility.

5. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires 1) that State agencies' actions, including direct energy development activities such as those undertaken by the Power Authority of the State of New York, must be consistent with the environmental protection and development policies of this act. This provision of law is implemented by amendments to SEQR (below) and by DOS regulations. DOS regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and 3) that SEQR regulations be amended to reflect consideration of coastal resources.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.

6. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)

Under the State Environmental Quality Review Act, State agencies and local governments are required to prepare an environmental impact statement for any action that might have a significant impact upon the environment. This requirement applies to large scale energy facilities other than transmission lines and steam electric generating plants as described above. The environment is broadly defined to include existing patterns of development and land resources. Actions which have been subject to an environmental impact statement must, consistent with social, economic, and other essential considerations, minimize or avoid, to the maximum extent practicable, the adverse environmental effects revealed in the impact statement (Environmental Conservation Law Article 8, Section 0109, Subdivision 8). In addition, pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that for actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies.

7. Water Resources Law, Environmental Conservation Law (Article 15)

Proposals, including those to construct all pipelines, which would excavate or deposit fill in any navigable waters and adjacent marshes and estuaries of the State require permits issued by the Department of Environmental Conservation.

8. Tidal Wetlands Act, Environmental Conservation Law (Article 25)

The Tidal Wetlands Act requires that a permit be issued for uses, including oil pipelines, in identified tidal wetlands. It must be demonstrated that proposed facilities will not adversely affect water quality, flood and storm control, marine food production, wild-life habitats, open space, and aesthetically significant areas.

9. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
The Freshwater Wetlands Act requires that a permit be issued for uses, including oil pipelines, in identified freshwater wetlands. It must be demonstrated that proposed facilities will not adversely affect water quality, flood and storm control, erosion control, subsurface water resources, wildlife habitats, freshwater fish sanctuaries, open space, and aesthetically significant areas.
10. Oil Spill Prevention, Control and Compensation, Navigation Law (Article 12)
This Article provides for the protection of the State's environment and economy by preventing unregulated discharge of petroleum from major facilities; by authorizing the Departments of Environmental Conservation and Transportation to respond quickly to remove any discharges; and by establishing liability for any damages sustained within the State as a result of such discharges.

The Article also creates a fund for clean-up, restoration and compensation for damages caused by oil spills. Before a license to construct a major oil facility can be issued by the Department of Transportation, an applicant must pay the required fee to help maintain the fund and must show that the necessary equipment to prevent, contain and remove petroleum discharges will be provided. The Department will issue licenses for major onshore facilities only after the Department of Environmental Conservation has, certified that the applicant has the necessary equipment to control oil discharges.
11. State Pollutant Discharge Elimination System, Environmental Conservation Law (Article 27)
This Article requires permits for construction of new outlets or new disposal systems to discharge industrial and other wastes into State waters, including wastes from nuclear power plants, other steam electric generating plants, and petroleum facilities. This permit procedure ensures that established water quality standards are met.
12. Powers and Duties (Air Pollution Control), Environmental Conservation Law (Article 19, Title 3)
This Article gives the Department of Environmental Conservation the authority to promulgate and enforce regulations controlling air emissions, including those released by energy facilities. These regulations appear in the State Implementation Plan which details State strategies for meeting federal air quality standards under the Clean Air Act.
13. Environmental Protection Act, Environmental Conservation Law (Article 54)
14. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
15. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
16. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

18. 2015 New York State Energy Plan
19. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6, Chapter IV, Subchapter H, Part 487)

6 NYCRR Part 487 regulations define environmental justice (EJ) as the fair treatment and meaningful involvement of all people regardless of race, color, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. The regulations set requirements for the consideration of environmental justice issues as part of the Article 10 major electric generating facilities siting process. Part 487 requires consideration of cumulative environmental and health impacts, including an environmental justice analysis with specific cumulative impact analysis of air quality. It also requires early and meaningful opportunities for public participation, including the availability of intervenor funding, and the publication of communications and notices in languages other than English which are spoken by a significant portion of the potentially impacted community. Regulations also require a specific evaluation of any significant and adverse disproportionate environmental impacts which may result from the proposed project or which the proposed project may contribute to during its construction or operation. If the New York State Board on Electric Generation Siting and the Environment (Siting Board) finds that a project would result in or contribute to a significant and adverse environmental impact, the Siting Board must also find that the project applicant has avoided, minimized, or offset those impacts to the maximum extent practicable.
20. State Energy Planning Procedures (New York Codes, Rules and Regulations Title 9, Subtitle BB, Chapter III, Subchapter B, Parts 7844-7852)

9 NYCRR Parts 7844-7852, issued under Statutory authority of New York State Energy Law Article 6, Section 102.4b, provide details for the state energy planning procedures including initial scoping, commencement of the energy planning proceedings, filing and service of documents, writing and issuing the draft State Energy Plan, State Energy Planning Board public comment hearings and evidentiary hearings, subpoenas, granting of waivers, adoption of the final State Energy Plan, and amendments to the State Energy Plan
21. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

These regulations provide the guidance and substantive requirements for the siting of projects with electric generating capacity of twenty-five thousand kilowatts or more, including wind energy facilities located in State waters. The regulations establish procedures and requirements for assuring that the applicant will comply with the terms, conditions, limitations, or modifications of the construction and operation of the facility authorized in the certificate. These regulations establish procedures for applications for certificates, requiring applicants to: actively seek public participation throughout the planning, pre-application, certification, compliance, and implementation process; demonstrate consistency with state energy planning objectives; submit a preliminary scoping statement; obtain a water quality certification; and secure a coastal consistency

determination. The regulations also establish procedures affecting the construction or operation of major electric generating facilities pursuant to former Public Service Law Article VIII and Article X, so that the provisions will be applied in a manner that is consistent with former Article VIII of the Public Service Law remaining operative and continuing in full force and effect with regard to applications filed on or before December 31, 1978, and former Article X of the Public Service Law remaining operative and continuing in full force. Notwithstanding the Public Service Commission's authority to conduct the proceedings for the siting of the generating facilities, the Department of State retains its federal consistency review authority separate and apart from this process.

22. New York State Public Service Commission Order Adopting a Clean Energy Standard (Cases 15-E-0302 and 16-E-0270 - Issued and Effective August 1, 2016)
23. Regulations Implementing Article VII of the Public Service Law (New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter F, Part 84 Transmission Facilities Management; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 85 General Procedures; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 86 General Exhibits; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 87 Exhibits for Gas Transmission; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 88 Exhibits for Electric Transmission Filings; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter H, Part 89 Notification Requirements)

POLICY 28

Ice management practices shall not interfere with the production of hydroelectric power, damage significant fish and wildlife and their habitats, or increase shoreline erosion or flooding.

A. Explanation of Policy

Prior to undertaking actions required for ice management, an assessment must be made of the potential effects of such actions upon the production of hydro-electric power, fish and wildlife and their habitats as will be identified in the Coastal Area Maps, flood levels and damage, rates of shoreline erosion damage, and upon natural protective features.

Following such an examination, adequate methods of avoidance or mitigation of such potential effects must be utilized if the proposed action is to be implemented.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires: (1) that State agencies' actions, including funding, planning, land transactions, as well as direct development activities, must be consistent with the policies of this Act, which, among others, call for preventing the loss of fish and wildlife resources, minimizing damage to natural resources and property from flooding and erosion, and achieving the beneficial use of coastal resources. Those provisions of law are implemented by amendments to SEQR and by the Department of State regulations. In

addition, the Department of State regulations (19 NYCRR Part 600) provide that, for their direct actions which do not have a significant effect on the environment, State agencies certify that the action is consistent with the coastal policies, one of which is: “Ice management practices shall not interfere with the production of hydro-electric power, damage significant fish and wildlife and their habitats, nor increase shoreline erosion or flooding;” (2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy; and (3) that SEQR regulations be amended to reflect consideration of this policy.

2. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
Pursuant to Article 42 of the Executive Law, SEQR regulations are amended to require that actions by a State agency for which an EIS has been prepared, such actions shall be consistent with the coastal policies, one of which is: “Ice management practices shall not interfere with the production of hydro-electric power, damage significant fish and wildlife and their habitats, nor increase shoreline erosion or flooding.”
3. Energy Planning, Energy Law (Article 6)
4. Tidal Wetlands Act, Environmental Conservation Law (Article 25)
5. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)
6. Oil Spill Prevention, Control and Compensation, Navigation Law (Article 12)
7. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 29

The development of offshore uses and resources, including renewable energy resources, shall accommodate New York’s long-standing ocean and Great Lakes industries, such as commercial and recreational fishing and maritime commerce, and the ecological functions of habitats important to New York.

A. Explanation of Policy

The science of ecosystem connections between the coastal zone and offshore areas is increasingly better understood. The offshore environment is an ongoing focus of policy development at national, regional, and state levels. Within this context, New York seeks to accommodate long-standing offshore industries, such as commercial and recreational fishing and maritime commerce, while at the same time ensuring the ecological functioning of habitats important to New York, as the State considers the need for new offshore resource development and uses to occur.

While New York State has jurisdiction in its offshore waters, matters pertaining to the OCS are under the jurisdiction of the federal government. However, offshore resource development and

other uses on the OCS may affect coastal resources and uses important to New York. Consequently, the Department of State actively participates in OCS planning and decision making processes pursuant to the federal Outer Continental Shelf Lands Act and the Deepwater Port Act, among other federal statutes, and reviews and voices the State's concerns about federal OCS activities, licenses, permits, lease sales, plans, and other uses and activities. The federal government increasingly has invited State participation in offshore planning and decision-making processes. New York will continue to review and analyze federal licensing and permitting activities for federal consistency, including activities in offshore areas outside New York's coastal zone. Proponents of offshore activities should use available offshore data to identify and reduce the potential effects on New York's coastal resources, activities and uses. Project proponents should consider the compatibility with, and seek to accommodate, the existing presence of resources, activities and uses that are important to the coastal area of New York State.

In addition to the development of energy resources and the siting of energy facilities, offshore uses of particular concern to New York State because of their potential effects on State coastal uses and resources include, but are not limited to: fisheries management; aquaculture; sand and gravel mining; military readiness training and related exercises; changes or upgrades to established navigation patterns and infrastructure, including the re-routing of existing navigation lanes and the location, placement or removal of navigation devices which are not part of the routine operations under the Aids to Navigation (ATON) program; permits for deepwater ports; the identification of interim or permanent open-water dredged material disposal sites; the intentional submergence of vessels and other structures, including for the purpose of creating artificial reefs; the creation of human-made islands, tidal barriers, or the installation of other fixed structures; scientific research activities; and exploration and identification of potential resources for extraction, such as biopharmaceutical products.

In its review of proposed activities, licenses, permits, lease sales and plans in the Atlantic OCS and New York State coastal waters, the Department of State works with state and federal agencies to considers a number of factors, including but not limited to: the potential effects upon maritime traffic, including navigational safety leading into and from New York's ports; the potential for increased port development and economic activity; aspects of national security; the effects on important finfish, crustaceans, shellfish, seabirds, marine mammals, and other wildlife populations and their spawning, wintering, and foraging habitats and migrating corridors; impacts on biological communities and biodiversity; ecological functioning of ecosystems; economic and other effects upon commercial and recreational fishing activities; impacts upon tourism and public recreational resources and opportunities along the coasts and offshore; the potential for geo-hazards; water quality; and overall effects on the resilience of New York's coastal uses and resources.

Of special significance, New York State recognizes the need to develop energy resources, particularly those that contribute to achieving the State's energy goals, including greenhouse gas reduction. It also recognizes that any energy development may have reasonably foreseeable effects on existing coastal uses and resources. Among the various energy resources under consideration for development are those which may be found in offshore waters within the state's territorial limit or the Atlantic Outer Continental Shelf (OCS). There are currently no active licenses, permits, lease sales or plans for oil and gas exploration or production in the waters offshore New York State.

The State encourages the responsible development of renewable energy resources. Wind, wave, tidal, and water current resources located offshore New York are an increasing focus of development interest, which may continue to grow as projects become more technologically feasible. Offshore renewable wind energy development is a use which depends on the utilization of resources found in coastal waters. The State recognizes offshore projects directly interconnected to the New York electrical grid as qualifying for eligibility as a dependent use at the same level as though the facility were located within the State.

B. State Means for Implementing the Policy

1. Procedure for Obtaining Oil and Gas Production Lease, Environmental Conservation Law (Article 23, Title 11, Section 1101)

The Department of Environmental Conservation may lease the lands beneath Lake Erie according to specific siting, operation, and liability requirements. Thus the State's environmental agency will retain control over the process and ensure appropriate environmental safeguards. The production of liquid hydrocarbons is, however, prohibited by this Article.

2. Powers and Duties of the Commissioner and the Department, Environmental Conservation Law (Article 23, Title 3, Section 0305)

This law provides that the Department of Environmental Conservation will retain jurisdiction over any active or abandoned wells and wellheads and may limit production. The Department may act to terminate hazardous discharges which threaten natural resources. Under this law, producers and handlers must maintain accurate records of quantities of gas handled.

3. Siting of Major Utility Transmission Facilities, Public Service Law (Article VII)

This law establishes procedures to be followed by developers of natural gas in the construction of any gathering pipelines from wellheads and any master collecting pipelines in accordance with the environmental considerations of this Article as discussed under the previous policy.

4. General Powers of Commission in Respect to Gas and Electricity, Public Service Law (Article 4, Section 66)

Under this law, the Public Service Commission regulates the safe construction and operation of natural gas pipelines from the wellhead to any onshore connection.

5. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

6. Rules and Regulations (State Environmental Quality Review), Environmental Conservation Law (Article 8, Section 0113)

7. Water Resources Law, Environmental Conservation Law (Article 15)

8. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)

9. Tidal Wetlands Act, Environmental Conservation Law (Article 25)

10. Environmental Protection Act, Environmental Conservation Law (Article 54)

11. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
12. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
13. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
14. Energy Planning, Energy Law (Article 6)
15. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
16. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
17. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
18. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
19. 2015 New York State Energy Plan
20. Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10 (New York Codes, Rules and Regulations Title 6. Chapter IV. Subchapter H. Part 487)
21. State Energy Planning Procedures (New York Codes, Rules and Regulations Title 9, Subtitle BB, Chapter III, Subchapter B, Parts 7844-7852)
22. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)
23. New York State Public Service Commission Order Adopting a Clean Energy Standard (Cases 15-E-0302 and 16-E-0270 - Issued and Effective August 1, 2016)
24. Regulations Implementing Article VII of the Public Service Law (New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter F, Part 84 Transmission Facilities Management; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 85 General Procedures; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 86 General Exhibits; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 87 Exhibits for Gas Transmission; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter G, Part 88 Exhibits for Electric Transmission Filings; New York Codes, Rules and Regulations Title 16, Chapter I, Subchapter H, Part 89 Notification Requirements)

POLICY 30

Municipal, industrial, and commercial discharge of pollutants, including but not limited to, toxic and hazardous substances, into coastal waters will conform to State and National water quality standards.

A. **Explanation of Policy**

Municipal, industrial and commercial discharges include not only “end-of-the pipe” discharges into surface and groundwater but also plant site runoff, leaching, spillages, sludge and other waste disposal, and drainage from raw material storage sites. Also, the regulated industrial discharges are

both those which directly empty into receiving coastal waters and those which pass through municipal treatment systems before reaching the State's waterways.

B. State Means for Implementing the Policy

1. State Pollutant Discharge Elimination System, Environmental Conservation Law (Article 17, Title 8)
2. Industrial Hazardous Waste Management, Environmental Conservation Law (Article 27, Title 9)
3. Substances Hazardous or Acutely Hazardous to Public Health, Safety or the Environment, Environmental Conservation Law (Article 37)
4. State Certification of Public Sewage Treatment Plant Operators, Environmental Conservation Law (Article 3, Title 3, Section 0301, Subdivision bb),
5. Public Health and Health Planning Council; Powers and Duties; Sanitary Code, Public Health Law (Article 2, Title 2, Section 225)
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
8. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
11. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 31

State coastal area policies and management objectives of approved local Waterfront Revitalization Programs will be considered while reviewing coastal water classifications and while modifying water quality standards; however, those waters already over-burdened with contaminants will be recognized as being a development constraint.

A. Explanation of Policy

Pursuant to the federal Clean Water Act of 1977 (PL 95-217) the State has classified its coastal and other waters in accordance with considerations of best usage in the interest of the public and has adopted water quality standards for each class of waters. These classifications and standards are reviewable at least every three years for possible revision or amendment. Local Waterfront Revitalization Programs and State coastal management policies shall be factored into the review process for coastal waters. However, such consideration shall not affect any water pollution control requirement established by the State pursuant to the federal Clean Water Act.

The State has identified certain stream segments as being either "water quality limiting" or "effluent limiting." Waters not meeting State standards and which would not be expected to meet these

standards even after applying “best practicable treatment” to effluent discharges are classified as “water quality limiting.” Those segments meeting standards or those expected to meet them after application of “best practicable treatment” are classified as “effluent limiting,” and all new waste discharges must receive “best practicable treatment.” However, along stream segments classified as “water quality limiting,” waste treatment beyond “best practicable treatment” would be required, and costs of applying such additional treatment may be prohibitive for new development.

B. State Means for Implementing the Policy

1. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law, (Article 42)
2. Classification of Waters and Adoption of Standards, Environmental Conservation Law (Article 17, Title 3, Section 0301)
3. Environmental Protection Act, Environmental Conservation Law (Article 54)
4. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
5. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 32

Encourage the use of alternative or innovative sanitary waste systems in small communities where the costs of conventional facilities are unreasonably high, given the size of the existing tax base of these communities.

A. Explanation of Policy

Alternative systems include individual septic tanks and other subsurface disposal systems, dual systems, small systems serving clusters of households or commercial users, and pressure or vacuum sewers. These types of systems are often more cost effective in smaller less densely populated communities and for which conventional facilities are too expensive.

B. State Means for Implementing the Policy

1. State Aid: Collection, Treatment, and Disposal of Sewage, Environmental Conservation Law (Article 17, Title 19)
2. Appalachian Regional Development, Executive Law (Article 6B, Section 153, Subdivision 2)
3. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Approval of local waterfront revitalization programs authorized under Section 915 of this law would be contingent in part on the community’s demonstrated effort to provide necessary treatment of any sanitary wastes being generated at waterfront properties. When hookup to the municipal sewage collection and treatment facilities is neither economically

or technically feasible, installation of alternative treatment systems will be required as needed and practical.

4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. State Smart Growth Public Infrastructure Policy Act, Environmental Conservation Law (Article 6)
8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 33

Best management practices will be used to ensure the control of stormwater runoff and combined sewer overflows draining into coastal waters.

A. Explanation of Policy

Best management practices include both structural and non-structural methods of preventing or mitigating pollution caused by the discharge of stormwater runoff and combined sewer overflows. At present, structural approaches to controlling stormwater runoff (e.g., construction of retention basins) and combined sewer overflows (e.g., replacement of combined system with separate sanitary and stormwater collection systems) are not economically feasible. Proposed amendments to the Clean Water Act, however, will authorize funding to address combined sewer overflows in areas where they create severe water quality impacts. Until funding for such projects becomes available, non-structural approaches (e.g., improved street cleaning, reduced use of road salt) will be encouraged.

B. State Means for Implementing the Policy

1. Agreement of a Five Year Water Quality Management Program.
2. State “208” Water Quality Management Program
3. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)

7. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
8. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
9. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 34

Discharge of waste materials into coastal waters from vessels subject to State jurisdiction into coastal waters will be limited so as to protect significant fish and wildlife habitats, recreational areas and water supply areas.

A. Explanation of Policy

All untreated sanitary waste from vessels is prohibited from being discharged into the State's coastal waters. Where coastal resources or activities require greater protection than afforded by this requirement the State may designate vessel waste no discharge zones. Within these no discharge zones the discharge of all vessel waste whether treated or not is prohibited. A determination from EPA that an adequate number of vessel waste pumpout stations exists is necessary before the State can designate a no discharge zone. The State prepared a Clean Vessel Act Plan which identifies the coastal waters for which no discharge zones are needed and the number of vessel waste pump outs required to obtain the determination from EPA. The discharge of other wastes from vessels is limited by State law.

B. State Means for Implementing the Policy

1. Regulating Disposal of Sewage; Littering of Waterways, Navigation Law (Article 3, Section 33-c) and Marine Sanitation Devices Aboard Vessels in Vessel Waste No-Discharge Zones, Navigation Law (Article 3, Section 33-e)
2. Environmental Protection Act, Environmental Conservation Law (Article 54)
3. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
4. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
5. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
6. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42).
7. State Environmental Quality Review Act, Environmental Conservation Law (Article 8).
8. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)

10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 35

Dredging and filling in coastal waters and disposal of dredged material will be undertaken in a manner that meets existing State dredging permit requirements, and protects significant fish and wildlife habitats, scenic resources, natural protective features, important agricultural lands, and wetlands.

B. Explanation of Policy

Dredging, filling and dredge material disposal are activities that are needed for waterfront revitalization and development, such as maintaining navigation channels at sufficient depths, pollutant removal and other coastal management needs. Such projects, however, may adversely affect water quality, fish and wildlife habitats, wetlands and other important coastal resources. Often these adverse effects can be minimized through careful design and timing of the dredging or filling activities, proper siting of dredge material disposal sites, and the beneficial use of dredged material. Such projects shall only be permitted if they satisfactorily demonstrate that these anticipated adverse effects have been reduced to levels which satisfy State permit standards set forth in regulations developed pursuant to Environmental Conservation Law, (Articles 15, 24, 25 and 34), and are consistent with policies pertaining to the protection and use of coastal resources (State Coastal Management policies 7, 15, 19, 20, 24, 26 and 44).

B. State Means for Implementing the Policy

1. Protection of Water, Environmental Conservation Law (Article 15, Title 5)
2. Freshwater Wetlands Acts, Environmental Conservation Law (Article 24) and Tidal Wetlands Act, Environmental Conservation Law (Article 25)
3. State Environmental Quality Review Act, Environmental Conservation Law (Article 8)
4. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
5. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
6. Environmental Protection Act, Environmental Conservation Law (Article 54)
7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
8. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
10. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
11. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 36

Activities related to the shipment and storage of petroleum and other hazardous materials will be conducted in a manner that will prevent or at least minimize spills into coastal waters; all practicable efforts will be undertaken to expedite the cleanup of such discharges; and restitution for damages will be required when these spills occur.

A. Explanation of Policy

See Policy 39 for definition of hazardous materials.

B. State Means for Implementing the Policy

1. Oil Spill Prevention, Control and Compensation, Navigation Law (Article 12)
2. Penalties and Liability for Spills of Bulk Liquids, Environmental Conservation Law (Article 71, Title 19, Section 1941)
3. Transportation of Hazardous Materials, Transportation Law (Article 2, Section 14-F)
4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
6. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
7. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
8. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
9. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 37

Best management practices will be utilized to minimize the non-point discharge of excess nutrients, organics and eroded soils into coastal waters.

A. Explanation of Policy

Best management practices used to reduce these sources of pollution could include but are not limited to, encouraging organic farming and pest management principles, soil erosion control practices, and surface drainage control techniques.

B. State Means for Implementing the Policy

1. Detergents and Other Household Cleansing Products, Environmental Conservation Law (Article 35)
2. State Pollutant Discharge Elimination System, Environmental Conservation Law (Article 17, Title 8)

3. Realty Subdivisions: Sewerage Service, Environmental Conservation Law (Article 17, Title 15)
4. Freshwater Wetlands Act, Environmental Conservation Law (Article 24) and Tidal Wetlands Act, Environmental Conservation Law (Article 25)
5. Sanitary Code; Application, Public Health Law (Article 2, Title 2, Section 228)
6. State Water Quality Management (108) Program
7. Powers of Districts and Directors, Soil and Water Conservation Districts Law (Article 2, Section 9)
8. Environmental Protection Act, Environmental Conservation Law (Article 54)
9. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
10. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
11. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
12. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
13. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
14. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 38

The quality and quantity of surface water and groundwater supplies will be conserved and protected, particularly where such waters constitute the primary or sole source of water supply.

A. Explanation of Policy

Surface and groundwater are the principle sources of drinking water in the State, and therefore must be protected. Since Long Island’s groundwater supply has been designated a “primary source aquifer”, all actions must be reviewed relative to their impacts on Long Island’s groundwater aquifers.

B. State Means for Implementing the Policy

1. Water Well Drillers in New York State to Obtain Certificates of Registration, Environmental Conservation Law (Article 15, Title 15, Section 1525) and Permit Required for Certain Wells in Long Island Counties, Environmental Conservation Law (Article 15, Title 15, Section 1527)
2. Realty Subdivisions: Sewerage Service, Environmental Conservation Law (Article 17, Title 15)
3. Collection, Treatment and Disposal of Refuse and Other Solid Waste, Environmental Conservation Law (Article 27)

4. Industrial Hazardous Waste Management, Environmental Conservation Law (Article 27, Title 9)
5. Water Supply, Environmental Conservation Law (Article 15, Title 15)
6. Public Water Supplies; Sewerage and Sewage Control, Public Health Law (Article 11)
7. Detergents and Other Household Cleansing Products, Environmental Conservation Law (Article 35)
8. Sanitary Code; Application, Public Health Law (Article 2, Title 2, Section 228)
9. Waterfront Revitalization and Coastal Resource Act, Executive Law (Article 42)
10. Environmental Protection Act, Environmental Conservation Law (Article 54)
11. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
12. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
13. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
14. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
15. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
16. Water Supply, Environmental Conservation Law (Article 15, Title 15, Sections 1501, 1502, 1503, 1504, 1505, 1521, and 1529)
17. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 39

The transport, storage, treatment and disposal of solid wastes, particularly hazardous wastes, within coastal areas will be conducted in such a manner so as to protect groundwater and surface water supplies, significant fish and wildlife habitats, recreation areas, important agricultural lands and scenic resources.

A. Explanation of Policy

The definitions of terms “solid wastes” and “solid wastes management facilities” are taken from New York’s Collection, Treatment and Disposal of Refuse and Other Solid Waste (Environmental Conservation Law Article 27). Solid wastes include sludge from air or water pollution control facilities, demolition and construction debris and industrial and commercial wastes.

Hazardous wastes are unwanted byproducts of manufacturing processes generally characterized as being flammable, corrosive, reactive, or toxic. More specifically, waste is defined in Environmental Conservation Law (Article 27, Title 9, Section 0901, Subdivision 3) as waste or combination of wastes which because of its quantity, concentration, or physical, chemical or infectious characteristics may: 1) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness; or 2) pose a substantial present or

potential hazard to human health or the environment when improperly treated, stored, transported or otherwise managed.” A list of hazardous wastes (NYCRR Part 366) will be adopted by DEC within 6 months after EPA formally adopts its list.

Examples of solid waste management facilities include resource recovery facilities, sanitary landfills and solid waste reduction facilities. Although a fundamental problem associated with the disposal and treatment of solid wastes is the contamination of water resources, other related problems may include: filling of wetlands and littoral areas, atmospheric loading, and degradation of scenic resources.

B. State Means for Implementing the Policy

1. Collection, Treatment and Disposal of Refuse and Other Solid Waste, Environmental Conservation Law (Article 27)
2. Permits for Waste Transporters, Environmental Conservation Law (Article 27, Title 3, Section 0305)
3. Industrial Hazardous Waste Management, Environmental Conservation Law (Article 27, Title 9)
4. Freshwater Wetlands Act, Environmental Conservation Law (Article 24) and Tidal Wetlands Act, Environmental Conservation Law (Article 25)
5. Protection of Water, Environmental Conservation Law (Article 15, Title 5)
6. Coastal Erosion Hazard Areas, Environmental Conservation Law (Article 34)
7. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)
8. Environmental Protection Act, Environmental Conservation Law (Article 54)
9. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
10. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
11. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
12. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
13. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 40

Effluent discharged from major steam electric generating and industrial facilities into coastal waters will not be unduly injurious to fish and wildlife and shall conform to State water quality standards.

A. Explanation of Policy

The State Board on Electric Generation Siting and the Environment must consider a number of factors when reviewing a proposed site for facility construction. One of these factors is that the facility should “not discharge any effluent that will be unduly injurious to the propagation and

protection of fish and wildlife, the industrial development of the State, the public health, and public enjoyment of the receiving waters.” The effects of thermal discharges on water quality and aquatic organisms will be considered by the siting board when evaluating an applicant’s request to construct a new steam electric generating facility.

B. State Means for Implementing the Policy

1. Classification of Waters and Adoption of Standards, Environmental Conservation Law (Article 17, Title 3, Section 0301) and 6 NYCRR Part 704 Criteria Governing Thermal Discharges
2. Environmental Protection Act, Environmental Conservation Law (Article 54)
3. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
4. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
5. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
6. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
7. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
8. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
9. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
10. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 41

Land use or development in the coastal area will not cause national or State air quality standards to be violated.

A. Explanation of Policy

New York’s Coastal Management Program incorporates the air quality policies and programs developed for the State by the Department of Environmental Conservation pursuant to the Clean Air Act and State Laws on air quality. The requirements of the Clean Air Act are the minimum air quality control requirements applicable within the coastal area.

To the extent possible, the State Implementation Plan will be consistent with coastal lands and water use policies. Conversely, coastal management guidelines and program decisions with regard to land and water use and any recommendations with regard to specific sites for major new or expanded industrial, energy, transportation, or commercial facilities will reflect an assessment of their compliance with the air quality requirements of the State Implementation Plan.

The Department of Environmental Conservation will allocate substantial resources to develop a regulatory and management program to identify and eliminate toxic discharges into the atmosphere. The State's Coastal Management Program will assist in coordinating major toxic control programming efforts in the coastal regions and in supporting research on the multi-media nature of toxics and their economic and environmental effects on coastal resources.

B. State Means for Implementing the Policy

1. Air Pollution Control, Environmental Conservation Law (Article 19)
2. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
3. Protection of Water, Environmental Conservation Law (Article 15, Title 5)
4. Substances Hazardous or Acutely Hazardous to Public Health, Safety or the Environment, Environmental Conservation Law (Article 37)
5. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
6. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
7. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
8. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 42

Coastal Management policies will be considered if the State reclassifies land areas pursuant to the prevention of significant deterioration regulations of the Federal Clean Air Act.

A. Explanation of Policy

The policies of the State and local coastal management programs concerning proposed land and water uses and the protection and preservation of special management areas will be taken into account prior to any action to change prevention of significant deterioration land classifications in coastal regions or adjacent areas. In addition, the Department of State will provide the Department of Environmental Conservation with recommendations for proposed prevention of significant deterioration land classification designations based upon State and local coastal management programs.

B. State Means for Implementing the Policy

1. Air Pollution Control Act, Environmental Conservation Law (Article 19)
This law provides the Department of Environmental Conservation with the authority to designate areas of the State based upon degree of pollution that may be permitted. It allows the Department to consider that what may be proper for a residential area, for example, may not be proper for a highly developed industrial area.

2. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and 3) that SEQR regulations be amended to reflect consideration and impacts on the use and conservation of coastal resources.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.
3. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
4. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

POLICY 43

Land use or development in the coastal area must not cause the generation of significant amounts of the acid rain precursors: nitrates and sulfates.

A. Explanation of Policy

The New York Coastal Management Program incorporates the State's policies on acid rain. As such, the Coastal Management Program will assist in the State's efforts to control acid rain. These efforts to control acid rain will enhance the continued viability of coastal fisheries, wildlife, agricultural, scenic and water resources.

B. State Means for Implementing the Policy

1. Air Pollution Control Act, Environmental Conservation Law (Article 19)
2. Waterfront Revitalization of Coastal Areas and Inland Waterways, Executive Law (Article 42)

Section 919 of Article 42 requires 1) that State agencies actions, including funding, planning, and land transactions, as well as direct development activities, must be consistent with the policies of this act, 2) that the Secretary of State shall review actions of State agencies that may affect achievement of the policy, and 3) that SEQR regulations be amended to reflect consideration of impacts on the use and conservation of coastal resources.

Section 2 of the law requires that State agencies analyze their programs' consistency with coastal policies and that the Secretary of State recommends any needed modifications to the Governor and the Legislature.
3. Environmental Protection Act, Environmental Conservation Law (Article 54)

4. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
5. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
6. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
7. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)
8. Siting of Major Electric Generating Facilities, Public Service Law (Article 10)
9. Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011 (New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002)

POLICY 44

Preserve and protect tidal and freshwater wetlands and preserve the benefits derived from these areas.

A. Explanation of Policy

Tidal wetlands include the following ecological zones: coastal fresh marsh; intertidal marsh; coastal shoals, bars and flats; littoral zone; high marsh or salt meadow; and formerly connected tidal wetlands. These tidal wetland areas are officially delineated on the Department of Environmental Conservation's Tidal Wetlands Inventory Map.

Freshwater wetlands include marshes, swamps, bogs, and flats supporting aquatic and semi-aquatic vegetation and other wetlands so defined in the NYS Freshwater Wetlands Act and the NYS Protection of Waters Act (Water Resources Law, Environmental Conservation Law Article 15).

The benefits derived from the preservation of tidal and freshwater wetlands include but are not limited to:

- habitat for wildlife and fish, including a substantial portion of the State's commercial finfish and shellfish varieties; and contribution to associated aquatic food chains;
- erosion, flood and storm control;
- natural pollution treatment;
- groundwater protection;
- recreational opportunities;
- educational and scientific opportunities; and
- aesthetic open space in many otherwise densely developed areas.

B. State Means for Implementing the Policy

1. Tidal Wetlands Act, Environmental Conservation Law (Article 25)

This act is designed to "preserve and protect tidal wetlands, and to prevent their despoliation and destruction, giving due consideration to the reasonable economic and social development of the State". The regulatory program associated with the act is

contained in the NYCRR, Title 6, Parts 660 and 661. Part 660 describes a moratorium regulatory program, while Part 661 details a permanent regulatory program.

The moratorium program provided interim protection to wetlands while the tidal wetlands inventory was being completed. Once maps were filed with the appropriate local governments, the moratorium on development in the majority of wetlands was lifted and permanent land use regulations went into effect.

For the purposes of the Tidal Wetlands Act, the permanent regulations apply to the six tidal wetland types and divide land uses into four categories: uses not requiring a permit; generally compatible uses; presumptively incompatible uses; and incompatible uses. All but the first category are subject to permit restrictions. More specifically, regulated uses include draining, dredging, excavation, filling, construction of facilities, pollution, and land subdivision.

Each application for a permit is subject to a hearing. A notice of public hearing is sent to affected parties. If no objections are received, the hearing may be cancelled. The application is then reviewed and denied or granted with conditions to minimize impact. Permits may be suspended or revoked upon grounds stated in the regulations.

2. Freshwater Wetlands Act, Environmental Conservation Law (Article 24)

This act authorizes the regulation of the use and development of the State's freshwater wetlands of 12.4 or more acres or of unusual local significance as determined by the Commissioner of DEC. The regulatory program is divided into two phases: the interim permit program and the permanent permit programs.

The interim permit program is described in the NYCRR, Title 6, Part 662. It is in effect in each locality until final county wetlands maps have been filed with the clerk of each local government and prior to implementation of a local freshwater wetlands protection law or ordinance.

Application for an interim permit must be made for certain alterations of regulated freshwater wetlands and adjacent areas within 100 feet of the wetland. Draining, dredging, filling, erecting structures and discharging pollutants are some of the activities which may substantially alter and impair the functions of a wetland. A public hearing may or may not be deemed necessary depending on the number of objections filed or the nature of the alteration. DEC will finally decide to issue, deny or condition an interim permit depending on the effect a proposed activity would produce on the benefits of a wetland.

The permanent program is fully described in NYCRR, Title 6, Parts 663 and 664. The permanent program takes effect in a particular county after DEC files its official regulatory maps with all of the local governments in that county. These maps depict freshwater wetlands of 12.4 acres or more plus certain smaller freshwater wetlands of special local concerns. These maps are filed after public hearings are held. At this writing only certain counties (and their constituent municipalities) have received these maps. Once these maps are completed, reviewed, and filed wetland laws adopted by communities become operative. These laws must be at least as restrictive as DEC's regulations. If a city, town or village fails to adopt and implement a local law, the county may take responsibility. If

the county fails to participate, DEC will regulate the wetlands. Any city, town or village which defaults or transfers its authority may recover it at any time.

Regulations for the permanent program contain standards for issuing permits to undertake specified activities. The standards are applied for four classes of wetlands granted according to their abilities to perform wetland functions and provide wetland benefits. DEC retains authority over Class I (highest quality) wetlands and certain other wetlands for reasons of size or other special characteristics. Where a local government has authority over a wetland associated with a major international or interstate river or lake (i.e., the Hudson, Niagara and St. Lawrence Rivers, and Lakes Erie and Ontario), it must consult with DEC before taking any regulatory action concerning that wetland.

3. Protection of Water, Environmental Conservation Law (Article 15, Title 5)
This law effectively affords State regulatory protection to any remaining wetland areas not being protected under the Freshwater Wetlands Act. This law requires that a permit be obtained from the Department of Environmental Conservation for any activities which require excavation or filling of all wetlands that are adjacent to and contiguous with navigable waters of the State, and that are inundated at mean high water level. Furthermore, wetlands associated with protected waters (streams and rivers classified C(T) or higher) tributary to navigable waters are also protected by this law.
4. Environmental Protection Act, Environmental Conservation Law (Article 54)
5. Implementation of the Clean Water/Clean Air Bond Act of 1996, Environmental Conservation Law (Article 56)
6. Grants of Land Under Water, Public Lands Law (Article 6, Section 75)
7. Long Island South Shore Estuary Reserve, Executive Law (Article 46)
8. Seagrass Protection Act, Environmental Conservation Law (Article 13, Title 7)
9. New York Ocean and Great Lakes Ecosystem Conservation Act, Environmental Conservation Law (Article 14)
10. Community Risk and Resiliency Act (Chapter 355 of the Laws of 2014)

SECTION 7 – PLANNING PROCESSES

INTRODUCTION

Three planning processes are incorporated into the State Coastal Management Program. They are the Energy Facility Planning Process, the Shorefront Erosion/Mitigation Planning Process, and the Shorefront Access and Protection Process. These processes, which are described below, comply with federal regulations for the Coastal Zone Management Program.

ENERGY FACILITY PLANNING PROCESS

Section 306 (d)(2)(H) of the Coastal Zone Management Act of 1972, as amended, requires the management program of each State to include “a planning process for energy facilities likely to be located in, or which may significantly affect the coastal zone, including a process for anticipating the management of the impacts resulting from such facilities”.

I. Identification of Energy Facilities likely to Locate In, or Significantly Affect a State’s Coastal Area

Energy facilities likely to locate in, or significantly affect New York’s coastal area include electric generating facilities (oil, coal, nuclear, hydro-powered); electric and gas transmission facilities; oil and gas exploration, development, transfer and storage facilities (including LNG facilities); and alternative energy facilities (land-based and offshore wind, marine hydrokinetic, solar, biofuel, and geothermal).

II. Procedures for Assessing the Suitability of Sites for Such Facilities

1. General Planning

Under New York State Energy Law Article 6, a state energy planning board is established along with two regional planning councils. (§ 6-102). The state energy planning board has the power to adopt a state energy plan, adopt rules and regulations, issue subpoenas, and conduct hearings. Regional council members may solicit input from stakeholder interests within their region, including but not limited to local governments, municipal utilities, rural electric cooperatives, utilities, labor unions, ratepayers, businesses, trade associations, generators, and community organizations. Each regional planning council issues a report of regional recommendations in the development of a draft energy plan and submits this report to the state energy planning board.

In the exercise of its responsibilities, including the development of the state energy plan, the state energy planning board is to be guided by the following goals: improving the reliability of the state’s energy systems; insulating consumers from volatility in market prices; reducing the overall cost of energy in the state; and minimizing public health and environmental impacts, in particular, environmental impacts related to climate change. The state energy plan will also identify policies and programs designed to maximize cost-effective energy efficiency and conservation activities to meet projected demand growth.

The state energy planning board will delegate responsibility for implementing or overseeing prioritized energy policies and programs from the state energy plan to the most appropriate agency or authority.

Each agency or authority reports to the board annually regarding implementation progress and recommendations for adjustments to the program or goals. The board uses such progress reports to complete its required biennial reports and to guide subsequent state energy plans.

State Energy Plan

Under New York State Energy Law Article 6 (§ 6-104), the state energy planning board adopts the state energy plan. The plan includes the following components:

1. Ten year forecasts of the following:
 - Energy demands. This means the demand for electricity, natural gas, coal, petroleum products, including heating and transportation fuels, and alternate fuels, including ethanol and other biofuels, to the extent possible, taking into account energy conservation, load management and other demand-reducing measures which can be achieved in a cost-effective manner, including the basis for such projection. This includes an examination of possible alternate levels of demand and discussion of the forecasting methodologies and input variables used in making the forecasts.
 - Energy supply. This means energy supply requirements needed to satisfy demand for electricity, natural gas, coal, petroleum products, including heating and transportation fuels, and alternate energy sources and fuels, for each region of the state, and for the state as a whole. In respect to electricity, this also includes the amount of capacity needed to provide adequate reserve margins and capacity needed to ensure reliability and competitive markets in the various regions of the state.
 - Energy infrastructure and delivery system reliability. This means an assessment of the ability of the existing energy supply sources and the existing transmission or fuel transportation systems, to satisfy, together with those sources or systems reasonably certain to be available, such energy supply requirements, indicating planned additions, retirements, deratings, substantial planned outages, and any other expected changes in levels of generating and production capacity.
 - The gap in unmet energy needs. This means additional electric capacity and/or transmission or fuel transportation systems needed to meet the energy supply requirements that will not be met by existing sources of supply and those reasonably certain to be available. This analysis should identify system constraints and possible alternatives available, both supply-side and demand-side alternatives, including distributed generation, energy efficiency and conservation measures to redress constraints.
 - Greenhouse gas emissions.
2. Identification and assessment of energy supply alternatives. This includes the costs, risks, benefits, uncertainties and market potential of energy supply source alternatives, including demand-reducing measures, renewable energy resources of electric generation, distributed generation technologies, cogeneration technologies, biofuels and other methods and technologies available for satisfying energy supply requirements which cannot be met by the energy supply sources.
3. Identification and analysis of emerging energy trends. This includes energy supply, price and demand, and trends related to the transportation sector.

4. Assessment of current energy policies and programs. This includes an assessment of their ability to achieve long-range energy planning objectives including the least cost integration of energy supply sources, energy transportation and distribution system and demand-reducing measures for satisfying energy supply requirements. Factors include capital investments, cost, ratepayer impacts, security and diversity of fuel supplies and generating modes, protection of public health and safety, adverse and beneficial environmental impacts, conservation of energy and energy resources, the ability of the state to compete economically, and any other policy objectives deemed appropriate.
5. Submissions from the Power Authority of the State of New York and the Long Island Power Authority including a strategic plan with an explanation of how it relates to the state energy plan, an annual five-year operating plan, and a ten-year projected capital budget for operations.
6. An analysis of natural and human threats to the security of the state's energy systems.
7. An environmental justice analysis.
8. An assessment of the ability of urban planning alternatives like smart growth and mass transportation improvements to reduce energy and transportation fuel demand.
9. An inventory of greenhouse gas emissions, and strategies for using low carbon energy sources and/or carbon mitigation measures.
10. Recommendations for administrative and legislative actions to implement energy policies, objectives and strategies.
11. An assessment of the state energy plan impacts on economic development, health, safety and welfare, environmental quality, and energy costs for consumers, especially low-income consumers.

The state energy plan will consider any comprehensive reliability planning undertaken by the electric bulk system operator (BSO), and shall provide guidance for energy-related decisions to be made by the public and private sectors within the state. Any energy-related action or decision of a state agency, board, commission or authority shall be reasonably consistent with the forecasts and the policies and long-range energy planning objectives and strategies contained in the plan, including its most recent update; provided, however, that any such action or decision which is not reasonably consistent with the plan shall be deemed in compliance with this section, provided that such action or decision includes a finding that the relevant provisions of the plan are no longer reasonable or probable based on a material and substantial change in fact or circumstance, and a statement explaining the basis for this finding. A state agency, board, commission or authority may take official notice of the most recent final state energy plan adopted by the board prior to any final energy-related decision by such agency, board, commission or authority. The components of the state energy plan will be made public on a statewide basis.

State Energy Planning Proceeding

Every four years, the board shall adopt a state energy plan, however, the board may adopt such a plan more frequently for good cause shown. The board shall prepare biennial reports, every second year following the issuance of the final state energy plan, including a discussion and evaluation of the ability of the state and private markets to implement the policies, programs, and other recommendations as found in the state energy plan, and recommendations for new or amended policies as needed to continue successful movement towards implementation and realization of such policies and programs. The

board shall conduct a state energy planning proceeding, consistent with the need to develop the plan in a timely manner, which shall provide for the following at a minimum:

- The filing of information by energy suppliers as specified in subdivision three of this section;
- The preparation and issuance of a draft plan, subsequent to the filing of information as specified in subdivision three of this section, which shall address each item identified in subdivision two of section 6-104 of this article;
- Public comment hearings, with at least three in each region described in subdivision two of section 6-102 of this article and provide an opportunity to submit written comments, subsequent to the issuance of a draft plan, to obtain views and comments of interested persons on any aspect of, or issue addressed in, such draft plan;
- Evidentiary hearings may be held, at the discretion of the board, in response to a written request by an interested person or persons seeking to provide evidentiary material or data subsequent to the issuance of a draft plan, on issues identified in subdivision two of section 6-104 of this article; and
- Submission of a notice for any hearing or opportunity for comment provided for pursuant to this subdivision for publication within the state register.

The board will determine the appropriate required information to be provided to the board by energy transmission and distribution companies, electric, gas, or steam corporations, major energy suppliers including owners or operators of electric generation facilities, commodity and/or end-use energy service providers, state agencies or authorities, including the power authority of the state of New York and the Long Island power authority, and/or others, shall include the following:

- Comprehensive long-range plans for future operations including:
 - A forecast of electricity demands over a period as the board may determine appropriate, including annual in-state electric energy sales and summer and winter peak loads by utility service area where applicable, and total any annual in-state electric energy sales and coincident peak load, specifically identifying the extent to which energy conservation, load management and other demand-reducing measures, and electric energy generated by cogeneration, small hydro and alternate energy production facilities, including renewable energy technologies and fuel cells, consumed on site, have been incorporated within such forecast;
 - A forecast of electricity supply requirements over a period as the board may determine appropriate, by utility service area where applicable, specifically identifying the reserve margins required for reliable electric service, the transmission and distribution losses assumed, and the amount of out-of-state sales commitments;
 - An assessment of the ability of existing electricity supply sources, and those reasonably certain to be available, to satisfy electricity supply requirements, including electric generating facilities which can be retained in service beyond their original design life through routine maintenance and repairs;
 - An inventory of: all existing electric generating and transmission facilities including those owned or operated by the power authority of the state of New York and the Long Island power authority; electric generating and transmission facilities planned or under

construction including the power authority of the state of New York and the Long Island power authority, including the dates for completion and operation; the anticipated retirement dates for any electric generating facilities currently operated including those owned or operated by the power authority of the state of New York and the Long Island power authority; land owned or leased including that owned or leased by the power authority of the state of New York and the Long Island power authority and held for future use as sites for major electric generating facilities; and electric generating, transmission, and related facilities operated, or planned to be operated, by others, to the extent information concerning the same is known;

- Recommended supply additions and demand-reducing measures for satisfying the electricity supply requirements, not reasonably certain to be met by electricity supply sources, including the life extension of existing electric generating facilities, and reasons therefor;
 - A statement of research and development plans, including objectives and programs in the areas of energy conservation, load management, electric generation and transmission, new energy technologies and pollution abatement and control, which are not funded through regulatory required programs, recent results of such programs undertaken or funded to date, and an assessment of the potential impacts of such results;
 - A projection of estimated electricity prices to consumers over the forecast period, and a sensitivity analysis of that forecast relating to a number of factors including fuel prices and the levels of available capacity and demand in the regions of the state;
 - A description of the load forecasting methodology and the assumptions and data used in the preparation of the forecasts, specifically including projections of demographic and economic activity and such other factors, statewide and by service area, which may influence electricity demand, and the bases for such projections;
 - Proposed policies, objectives and strategies for meeting the state's future electricity needs; and
 - Such additional information as the board may, by regulation, require to carry out the purposes of this article.
- All providers of natural gas transmission, distribution and/or marketing services to customers shall individually prepare and submit a comprehensive long-range plan for future operations, which shall include, as appropriate:
 - A forecast over a period as the board may determine appropriate, by utility service area, of estimated annual in-state gas sales, winter season sales and peak day sales by appropriate end-use classifications, specifically identifying the extent to which energy conservation measures and the sale of gas owned by persons other than natural gas transmission and distribution utilities have been incorporated within such forecast;
 - A forecast of gas supply requirements over a period as the board may determine appropriate, by utility service area, specifically identifying the amounts of gas needed to

meet severe weather conditions, lost and unaccounted for gas, out-of-state sales commitments and internal use;

- An assessment of the ability of existing gas supply sources, and those reasonably certain to be available, to satisfy gas supply requirements;
 - An inventory of: (A) all existing supply sources, storage facilities, and transmission facilities which are used in providing service within the state, (B) the transmission and storage facilities under construction which would be used in providing service within the state, their projected costs and capacities, including peaking capacity, (C) transmission facility additions proposed to be constructed by natural gas transmission and distribution utilities, (D) transmission facilities operated, or planned to be operated, by others, to the extent information concerning the same is known;
 - Recommended supply additions and demand-reducing measures for satisfying the gas supply requirements, not reasonably certain to be met by gas supply sources and the reasons therefor;
 - A projection of estimated gas prices to consumers over the forecast period, and a sensitivity analysis of that forecast relating to a number of factors including the levels of commodity supply availability, of available pipeline and storage capacity, and of demand in the regions of the state;
 - A description of the load forecasting methodology and the assumptions and data used in the preparation of the forecasts, specifically including projections of demographic and economic activity and such other factors, statewide and by service area where applicable, which may influence demand for natural gas, and the bases for such projections;
 - A statement of research and development plans, including objectives and programs in the areas of energy conservation and new energy technologies, recent results of such programs undertaken or funded to date, and an assessment of the potential impacts of such results;
 - Proposed policies, objectives and strategies for meeting the state's future gas needs; and
 - Such additional information as the board may, by regulation, require to carry out the purposes of this article.
- Such information from major petroleum suppliers and major coal suppliers as the board may require to carry out the purposes of this article.
 - Such other information from owners and operators of electric generating power plants as the board may require to carry out the purposes of this article.
 - A single comprehensive submission from industry groups, trade associations, or combinations of such groups and associations in place of submissions by individual member companies.

Any information filed under this section that is claimed to be confidential shall be treated in accordance with regulations adopted by the board pertaining to the determination of confidential status and the retention of confidential records. Copies of the draft plan, and all non-confidential information and comments filed pursuant to this section shall be made available to the public for inspection.

The board may amend the state energy plan, or aspects thereof, upon its own initiative or upon the written application of any interested person. In connection with any such amendment, the board may require the filing of such information as may be required, consistent with regulation. Prior to adopting any proposed amendment to an element of the plan identified in subdivision two of section 6-104 of this article, the board shall hold public comment hearings and may hold evidentiary hearings upon the written application of an interested party. Prior to adopting a proposed amendment to any element of the plan, the board shall prepare and publish in the state register notice of any draft amendment and reasons therefor and shall solicit public comments thereon. The board shall adopt an amendment to the state energy plan, or aspects thereof, upon a finding by the board that there has been a material and substantial change in fact or circumstance since the most recent plan was adopted. A decision of the board that no amendment is necessary, together with the reasons supporting such determination, shall be final.

Any person who participated in the state energy planning proceeding or any person who sought an amendment of the state energy plan pursuant to subdivision six of this section, may obtain, pursuant to article seventy-eight of the civil practice law and rules, judicial review of the board's decision adopting a plan, or any amendment thereto, or of the board's decision not to amend such plan pursuant to subdivision six of this section. Any such special proceeding shall be brought in the appellate division of the supreme court of the state of New York for the third judicial department. Such proceeding shall be initiated by the filing of a petition in such court within thirty days after the issuance of a decision by the board. The proceeding shall have a lawful preference over any other matter, shall be heard on an expedited basis and shall be completed in all respects, including any subsequent appeal, within one hundred eighty days of the filing of the petition. Where more than one such petition is filed, the court may provide for consolidation of the proceedings. Notwithstanding the provisions of article seven of the public service law, the procedure set forth in this section shall constitute the exclusive means for seeking judicial review of any element of the plan.

Proceedings conducted pursuant to this section shall not be considered part of an adjudicatory proceeding as defined in subdivision three of section one hundred two of the state administrative procedure act, or part of a rule making proceeding held under subdivision one of section two hundred two of the state administrative procedure act.

Supplemental Studies for Future Energy Planning

The board shall undertake the following studies to supplement information for future energy planning:

1. On or before September first, two thousand twelve, and every four years thereafter, the board shall undertake a study of the overall reliability of the state's electric transmission and distribution system. The board may contract with an independent and competitively selected contractor to undertake such study. The board shall prepare a report on such study's findings and legislative recommendations. The board shall transmit such report along with the reliability study to the governor, the speaker of the assembly, the temporary president of the senate, the chair of the assembly energy committee, and the chair of the senate energy and telecommunications committee.
2. Such study shall include, at a minimum, an assessment of each of the following:

- (a) the current and projected reliability of the electric power system over the term of the planning period, with specific focus on transmission systems and distribution systems within the state. The assessment shall examine: (i) investment in infrastructure, including capital improvements, expansions, and maintenance; and (ii) workforce utilization.
 - (b) the potential impact of the following on distribution system reliability and on each factor enumerated in paragraph (a) of this subdivision: (i) distributed electric generation, especially generation using renewable or innovative energy resources; (ii) energy conservation and efficiency; (iii) load control and peak saving measures; (iv) corporate reorganization of electric utilities; (v) performance ratemaking, multi-year rate agreements, and other departures from traditional regulatory mechanisms; and (vi) large scale industrial development.
 - (c) the potential impact of the following on transmission system reliability: (i) each factor enumerated in paragraph (b) of this subdivision; (ii) changes in protocols for electricity dispatched through the BSO or its successor or successors; (iii) accommodation of proposed new electric generation facilities or repowering or life extension of existing facilities; and (iv) the market-driven nature of decisions to build, size, and locate such facilities.
3. The board and any contractors it may retain for such purposes shall consult with entities that have resources and expertise to assist in such study, including, but not limited to, the BSO, public utilities, and any other electric company or trade organizations.
- (a) The Long Island power authority, the power authority of the state of New York, the department of public service, and the BSO shall cooperate with the board and its contractor.
 - (b) The Long Island power authority and the power authority of the state of New York are authorized, as deemed feasible and advisable by their respective boards, to make a voluntary contribution toward the study.

2. Activity Specific Processes

More specific procedures for siting individual facilities depend on the facility involved.

a. Siting of Major Electric Generating Facilities

The siting of Major Electric Generating Facilities in New York State, including site preparation and construction of a facility with a nameplate generating capacity of twenty-five thousand kilowatts or more, or increasing the capacity of an existing electric generating facility by more than twenty-five thousand kilowatts, must first obtain a Certificate of Environmental Compatibility and Public Need (Certificate) issued by the New York State Board on Electric Generation Siting and the Environment (Board). No new or expanded major electric generating facilities can be built, maintained or operated in New York State without conforming to the requirements spelled out in the Certificate of Environmental Compatibility and Public Need.

Any entity proposing to submit an application for a Certificate shall file a preliminary scoping statement with the Board. The preliminary scoping statement is to contain the following items:

- (a) a description of the proposed facility and its environmental setting;

- (b) potential environmental and health impacts resulting from the construction and operation of the proposed facility;
- (c) proposed studies or program of studies designed to evaluate potential environmental and health impacts, including, for proposed wind-powered facilities, proposed studies during pre-construction activities and a proposed period of post-construction operations monitoring for potential impacts to avian and bat species;
- (d) measures proposed to minimize environmental impacts;
- (e) if the proposed facility intends to use petroleum or other back-up fuel for generating electricity, a discussion and/or study of the sufficiency of the proposed on-site fuel storage capacity and supply;
- (f) reasonable alternatives to the facility;
- (g) identification of all other state and federal permits, certifications, or other authorizations needed for construction, operation or maintenance of the proposed facility; and
- (h) any other information that may be relevant or that the Board may require.

To facilitate the pre-application and application processes and enable citizens to participate in decisions that affect their health and safety and the environment, opportunities for citizen involvement shall be provided. The process shall foster the active involvement of the interested or affected persons. This includes consultation with the public early in the pre-application and application processes. The primary goals of the citizen participation process shall be to facilitate communication between the applicant and interested or affected persons.

An applicant may consult with any interested person, including staff of the Department of Public Service, the Department of Environmental Conservation and the Department of Health, concerning any aspect of the preliminary scoping statement and any study used to support the application. The staff of the Department of Public Service, the Department of Environmental Conservation and the Department of Health, the potential applicant, and any other interested person may enter into a stipulation setting forth an agreement on any aspect of the preliminary scoping statement and the studies or program of studies to be conducted. In order to attempt to resolve any questions that may arise as a result of such consultation, the Department of Public Service shall designate a hearing examiner who shall oversee the pre-application process and mediate any issue relating to any aspect of the preliminary scoping statement and the methodology and scope of any such studies or programs of study. Upon completion of the notice provisions and within sixty days of the filing of a preliminary scoping statement, the hearing examiner shall convene a meeting of interested parties in order to initiate the stipulation process.

An applicant for a Certificate shall file an application with the Board. The application shall contain the following information and materials:

- (a) A description of the facility to be built, and a description of the site, including available site information, maps and descriptions, present and proposed development, source and volume of water required for plant operation and cooling, anticipated emissions to air,

including federal criteria pollutants and mercury, anticipated discharges to water and groundwater, pollution control equipment, and geological, visual or other aesthetic, ecological, tsunami, seismic, biological, water supply, population and load center data;

(b) An evaluation of the expected environmental and health impacts and safety implications of the facility, both during its construction and its operation, including

- any studies used in the evaluation that identify the anticipated gaseous, liquid and solid wastes to be produced at the facility and their source, anticipated volumes, composition and temperature, and any other attributes as the Board may specify; and the probable level of noise during construction and operation of the facility;
- the treatment processes to reduce wastes to be released to the environment, the manner of disposal for wastes retained, and measures for noise abatement;
- the anticipated volumes of wastes to be released to the environment under any operating condition of the facility, including such meteorological, hydrological and other information needed to support such estimates;
- conceptual architectural and engineering plans indicating compatibility of the facility with the environment;
- how the construction and operation of the facility, including transportation and disposal of wastes, would comply with environmental health and safety standards, requirements, regulations and rules under state and municipal laws, and a statement why any variances or exceptions should be granted;
- water withdrawals from and discharges to the watershed;
- a description of the fuel interconnection and supply for the project; and
- an electric interconnection study, consisting generally of a design study and a system reliability impact study.

(c) Any evidence that will enable the Board and the Commissioner of Environmental Conservation to evaluate the facility's pollution control systems and to reach a determination to issue permits in accordance with the federal Clean Water Act, the federal Clean Air Act and the federal Resource Conservation and Recovery Act, and permits pursuant to section 15-1503 and article nineteen of the environmental conservation law;

(d) Where the proposed facility intends to use petroleum or other back-up fuel for generating electricity, evidence and an evaluation on the adequacy of the facility's on-site back-up fuel storage and supply;

(e) A plan for security of the proposed facility during construction and operation of such facility and the measures to be taken to ensure the safety and security of the local community, including contingency, emergency response and evacuation control, to be reviewed by the Board in consultation with the New York State Division of Homeland Security and Emergency Services. In cities with a population over one million, the plan shall also be reviewed by the local office of emergency management;

- (f) In accordance with rules and regulations promulgated by the Department of Environmental Conservation for the analysis of environmental justice issues, including an evaluation of any significant and adverse disproportionate environmental impacts of the proposed facility resulting from its construction and operation, including any studies that were used in the evaluation;
- (g) A cumulative impact analysis of air quality within a half-mile of the facility that considers available data associated with projected emissions of air pollutants from sources, including the facility, proposed facilities, existing sources, and sources permitted but not yet constructed;
- (h) A comprehensive demographic, economic and physical description of the community located within a half-mile radius of the location of the proposed facility, compared and contrasted with the county in which the facility is proposed and with adjacent communities within the county, including data on population, racial and ethnic characteristics, income levels, open space, and public health data, including incidents of asthma and cancer;
- (i) A description and evaluation of reasonable and available alternate locations to the proposed facility; a description of the comparative advantages and disadvantages as appropriate; and a statement of the reasons why the primary proposed location and source is best suited among the alternatives to promote public health and welfare, including the recreational and other concurrent uses;
- (j) For proposed wind-powered facilities, the expected environmental impacts on avian and bat species based on pre-construction studies, and a proposed plan to avoid or, where unavoidable, minimize and mitigate any such impacts during construction and operation of the facility based on existing information and results of post-construction monitoring proposed in the plan;
- (k) An analysis of the potential impact that the proposed facility will have on the wholesale generation markets, both generally and for the location-based market in which the facility is proposed, as well as the potential impact of the proposed facility on fuel costs;
- (l) A statement demonstrating that the facility is reasonably consistent with the most recent state energy plan, including impacts on fuel diversity, regional requirements for capacity, electric transmission and fuel delivery constraints and other issues, including the comparative advantages and disadvantages of reasonable and available alternate locations or properties identified for power plant construction, and a statement of the reasons why the proposed location and source is best suited, among the alternatives identified, to promote public health and welfare;
- (m) Other relevant information.

Copies of the application shall be filed with the Board and shall be available for public inspection. Each application shall be accompanied by proof of service. Public notice shall include the publication of a summary of the application and the date on or about which it will be filed. The summary will describe the proposed facility and its location, the range of potential environmental and health impacts of each pollutant, the application and review

process, and a contact person, with phone number and address, from whom information will be available as the application proceeds.

After the receipt of an application and within sixty days, the chair of the Board shall determine whether the application is in compliance, and if so, shall set a date for a public hearing. The Department of Environmental Conservation shall advise the Board within the sixty day period whether an application contains sufficient information meeting the requirements to qualify for an expedited procedure. The Department of Environmental Conservation shall initiate its review for environmental permitting. The chair of the Board may require the filing of any additional information needed to supplement an application before or during the hearings. Within a reasonable time after the date has been set for the public hearing, the presiding examiner shall hold a prehearing conference to specify the issues, to obtain stipulations of undisputed matters, and to deal with other matters as needed. The presiding examiner shall issue an order identifying the issues to be addressed by the parties. The order issued shall not preclude consideration of additional issues or requests for additional submissions, documentation or testimony in order to develop an adequate record. The presiding examiner shall be permitted a reasonable time of not more than forty-five days to respond to any and all motions and appeals. Hearings shall be of sufficient duration to provide adequate opportunity to hear direct evidence and rebuttal evidence from residents of the area affected by the proposed major electric generating facility.

Proceedings on an application shall be completed in consistence with federally delegated or approved environmental permitting authority, including a final decision by the Board, within twelve months from the date of a determination that an application is in compliance. The Board must render a final decision on the application by the deadlines unless such deadlines are waived by the applicant. If, at any time subsequent to the commencement of the hearing, there is a material and substantial amendment to the application, the deadlines may be extended by no more than six months in order to consider such amendment, unless the deadline is waived by the applicant. If an application for an amendment of a Certificate proposing a change in the facility is likely to result in any material increase in any environmental impact of the facility or a substantial change in the location of all or a portion of such facility, a hearing shall be held in the same manner as a hearing on an application for a Certificate.

The parties to the certification proceedings shall include: the applicant; the Department of Environmental Conservation; the Department of Economic Development; the Department of Health; the Department of Agriculture and Markets; the New York State Energy Research and Development Authority; the Department of State; the Office of Parks, Recreation and Historic Preservation; the Adirondack Park Agency (if the facility is to be located within the Adirondack Park); any municipality entitled to be a party and seeking to enforce any local ordinance, law, resolution or other action or regulation; any individual resident in a municipality entitled to receive a copy of the application; any non-profit corporation or association, formed in whole or in part to promote conservation or natural beauty, to protect the environment, personal health or other biological values, to preserve historical sites, to promote consumer interests, to represent commercial and industrial

groups or to promote the orderly development of any area in which the facility is to be located; any other municipality or resident of that municipality located within a five mile radius of the proposed facility, if it or the resident has filed with the Board a notice of intent to become a party; any other municipality or resident of that municipality which the Board finds to have an interest in the proceeding because of the potential environmental effects on that municipality or person; and other persons or entities as the Board may at any time deem appropriate.

The hearing shall be conducted in an expeditious manner by a presiding examiner appointed by the Department of Public Service. The presiding examiner shall allow testimony to be received on reasonable and available alternate locations for the proposed facility, alternate energy supply sources and demand-reducing measures, provided notice of the intent to submit such testimony shall be given within such period as the Board shall prescribe by regulation, which period shall be not less than thirty nor more than sixty days after the commencement of the hearing. The Board may consider other reasonable and available locations for the proposed facility, alternate energy supply sources and demand-reducing measures.

The Board shall make the final decision on an application for a Certificate or amendment. A determination that the applicant's proposal is preferable to alternatives shall be final. Such a determination shall be subject to rehearing and review only after the final decision on an application is rendered. The Board shall not grant a Certificate or amendment for the construction or operation of a facility, either as proposed or as modified by the Board, without making explicit findings regarding the nature of the probable environmental impacts of the construction and operation of the facility, including the cumulative environmental impacts of the construction and operation of related facilities such as electric lines, gas lines, water supply lines, waste water or other sewage treatment facilities, communications and relay facilities, access roads, rail facilities, or steam lines, including impacts on: ecology, air, ground and surface water, wildlife, and habitat; public health and safety; cultural, historic, and recreational resources, including aesthetics and scenic values; and transportation, communication, utilities and other infrastructure. Such findings shall include the cumulative impact of emissions on the local community including whether the construction and operation of the facility results in a significant and adverse disproportionate environmental impact, in accordance with regulations promulgated by the Department of Environmental Conservation regarding environmental justice issues.

The Board may not grant a Certificate for the construction or operation of a major electric generating facility, either as proposed or as modified by the Board, unless the Board determines that: the facility is a beneficial addition to or substitution for the electric generation capacity of the state; and the construction and operation of the facility will serve the public interest; and the adverse environmental effects of the construction and operation of the facility will be minimized or avoided to the maximum extent practicable; and, if the Board finds that the facility results in or contributes to a significant and adverse disproportionate environmental impact in the community in which the facility would be located, the applicant will avoid, offset or minimize the impacts caused by the facility upon the local community for the duration that the Certificate is issued to the maximum extent

practicable using verifiable measures; and the facility is designed to operate in compliance with applicable state and local laws and regulations issued thereunder concerning, among other matters, the environment, public health and safety, all of which shall be binding upon the applicant, except that the Board may elect not to apply, in whole or in part, any local ordinance, law, resolution or other action or any regulation issued thereunder or any local standard or requirement, including those relating to the interconnection to and use of water, electric, sewer, telecommunication, fuel and steam lines in public rights of way, which would be otherwise applicable if it finds that, as applied to the proposed facility, such is unreasonably burdensome in view of the existing technology or the needs of or costs to ratepayers whether located inside or outside of such municipality. The Board shall provide the municipality an opportunity to present evidence in support of such ordinance, law, resolution, regulation or other local action issued.

In making the determinations, the Board shall consider:

- (a) the state of available technology;
- (b) the nature and economics of reasonable alternatives;
- (c) environmental impacts found;
- (d) the impact of construction and operation of related facilities, such as electric lines, gas lines, water supply lines, waste water or other sewage treatment facilities, communications and relay facilities, access roads, rail facilities, or steam lines;
- (e) the consistency of the construction and operation of the facility with the energy policies and long-range energy planning objectives and strategies contained in the most recent state energy plan;
- (f) the impact on community character and whether the facility would affect communities that are disproportionately impacted by cumulative levels of pollutants; and
- (g) such additional social, economic, visual or other aesthetic, environmental and other considerations deemed pertinent by the Board.

The Department of Public Service or the Public Service Commission shall monitor, enforce and administer compliance with any terms and conditions set forth in the Board's order. In rendering a decision on an application for a Certificate, the Board shall issue an opinion stating its reasons for the action taken. If the Board has found that any local ordinance, law, resolution, regulation or other action issued thereunder or any other local standard or requirement which would be otherwise applicable is unreasonably burdensome, it shall state the reasons in its opinion.

b. Siting of Major Utility Transmission Facilities

The siting of a new major utility transmission facility in New York State must first obtain a Certificate of Environmental Compatibility and Public Need (Certificate) issued by the New York State New York State Public Service Commission (Commission). A major utility transmission facility includes any electric transmission line of a design capacity of one hundred twenty-five kilovolts or more extending a distance of one mile or more, or of one hundred kilovolts or more and less than one hundred twenty-five kilovolts, extending

a distance of ten miles or more, including associated equipment, but shall not include any such transmission line located wholly underground in a city with a population in excess of one hundred twenty-five thousand or a primary transmission line approved by the Federal Energy Regulatory Commission in connection with a hydro-electric facility. A major utility transmission facility also includes a fuel gas transmission line extending a distance of one thousand feet or more to be used to transport fuel gas at pressures of one hundred twenty-five pounds per square inch or more, excluding appurtenant facilities, but shall not include any such transmission line which is located wholly underground in a city or wholly within the right of way of a state, county or town highway or village street, or which replaces an existing transmission line, including appurtenant facilities, and extends a distance of less than one mile. No new major utility transmission facility can be built, maintained or operated in New York State without conforming to the terms, limitations or conditions contained in the Certificate of Environmental Compatibility and Public Need.

An applicant for a Certificate shall file an application with the Commission. The application should contain the following information:

- (a) the location of the site or right-of-way;
- (b) a description of the transmission facility to be built;
- (c) a summary of any environmental impact studies of the of the project, and a description of such studies (which are to be filed with the Commission and shall be available for public inspection);
- (d) a statement explaining the need for the facility;
- (e) a description of any reasonable alternate location or locations for the proposed facility, a description of the comparative merits and detriments of each location submitted, and a statement of the reasons why the primary proposed location is best suited for the facility; and
- (f) such other information as the applicant may consider relevant or the Commission may by regulation require.

Each application shall be accompanied by proof of service of:

- (a) a copy of such application on:
 - each municipality in which any portion of such facility is to be located, both as primarily proposed and in the alternative locations listed. Notice to a municipality shall be addressed to the chief executive officer thereof and shall specify the date on or about which the application is to be filed;
 - the Commissioner of Environmental Conservation, the Commissioner of Commerce, the Secretary of State, the Commissioner of Agriculture And Markets and the Commissioner of Parks, Recreation and Historic Preservation;
 - each member of the legislature through whose district the facility or any alternate proposed in the application would pass;
 - the Tug Hill Commission, if the facility is located within its jurisdiction;

- the Adirondack park agency, if the facility is located within the Adirondack park.

(b) a notice of such application on persons residing in municipalities entitled to receive notice.

Upon the receipt of an application, and not less than sixty nor more than ninety days afterward, the Commission shall set a date for a public hearing. The testimony presented at the public hearing may be presented in writing or orally, and the Commission shall make a record of all testimony in all contested hearings. On an application for an amendment of a Certificate, the Commission shall hold a hearing in the same manner as a hearing is held on an application for a Certificate if the change in the facility to be authorized would result in any material increase in any environmental impact of the facility or a substantial change in the location of the facility. A final determination regarding an application for a Certificate to construct transmission facilities for interconnection with a wind energy production facility located in the county of Lewis shall be rendered within six months from the date of receipt of a compliant application.

The parties to the certification proceedings shall include:

- (a) the applicant
- (b) the Department of Environmental Conservation
- (c) the Department of Commerce
- (d) the Secretary of State
- (e) the Department of Agriculture and Markets
- (f) the Office of Parks, Recreation and Historic Preservation
- (g) the Tug Hill Commission, if the facility is located within its jurisdiction
- (h) the Adirondack Park Agency, if the facility is located within the Adirondack park
- (i) a municipality entitled to receive notice, if it has filed with the Commission a notice of intent to be a party
- (j) any individual resident in a municipality entitled to receive notice, if he has filed with the Commission a notice of intent to be a party
- (k) any domestic non-profit corporation or association, formed to promote conservation or natural beauty, to protect the environment, personal health or other biological values, to preserve historical sites, to promote consumer interests, to represent commercial and industrial groups or to promote the orderly development of the areas in which the facility is to be located, if it has filed with the Commission a notice of intent to become a party
- (l) other persons or entities that the Commission deems appropriate.

The Commission shall designate members of its staff to represent the public interest in such proceedings. Any person may make a limited appearance in the proceeding, entitling such person to file a statement in writing, by filing a copy of such statement within sixty days

after the date given in the published notice as the date for filing the application. A record shall be made of the public hearing and of all testimony taken and the cross-examinations. The Commission may provide for the consolidation of the representation of parties, other than governmental bodies or agencies, having similar interests.

The Commission shall render a decision either granting or denying the application as filed or granting it with terms, conditions, limitations or modifications of the construction or operation of the facility. If the Commission denies the application, it shall file an opinion stating in full its reasons for the denial. The Commission shall not grant a Certificate for the construction or operation of a major utility transmission facility unless the Commission finds and determines:

- (a) the basis of the need for the facility;
- (b) the nature of the probable environmental impact;
- (c) that the facility represents the minimum adverse environmental impact, considering the state of available technology and the nature and economics of the various alternatives, and other pertinent considerations including the effect on agricultural lands, wetlands, parklands and river corridors traversed;
- (d) in the case of an electric transmission line,
 - what part, if any, of the line shall be located underground;
 - that the facility conforms to a long-range plan for expansion of the electric power grid of the electric systems serving New York State and interconnected utility systems, which will serve the interests of electric system economy and reliability;
- (e) in the case of a gas transmission line, that the location of the line will not pose an undue hazard to persons or property along the area traversed by the line;
- (f) that the location of the facility conforms to applicable state and local laws and regulations, all of which shall be binding upon the Commission, except that the Commission may refuse to apply any local ordinance, law, resolution or other action or any regulation issued thereunder or any local standard or requirement which would be otherwise applicable if it finds that as applied to the proposed facility such is unreasonably restrictive in view of the existing technology, or of factors of cost or economics, or of the needs of consumers whether located inside or outside of such municipality.
- (g) that the facility will serve the public interest, convenience, and necessity.

In the case of an electric transmission line to be constructed by the power authority of the state of New York and located in part under the waters of Long Island Sound and for the remaining part underground, the Commission shall make only the findings and determinations required by paragraphs (b), (c) and (f) of subdivision one of this section and, on the basis of such findings and determinations, shall grant, grant in part, or deny the Certificate. If the Commission determines that the location of all or a part of the proposed facility should be modified, it may condition its Certificate upon such modification, provided that the municipalities and persons residing in such municipalities affected by the

modification shall have had notice of the application as provided in subdivision two of section one hundred twenty-two.

In rendering a decision on an application for a Certificate, the Commission may issue an opinion stating its reasons for the action taken. If the Commission has found that any local ordinance, law, resolution, regulation, or other action issued or any other local standard or requirement which would be otherwise applicable is unreasonably restrictive, it shall state the reasons in its opinion.

Any party aggrieved by any order issued on an application for a Certificate may apply for a rehearing within thirty days after issuance of the order and then obtain judicial review of the order in a proceeding. Such proceeding shall be brought in the appellate division of the supreme court of the state in the judicial department embracing the county where the proposed facility is located. Such proceeding shall be initiated by the filing of a court petition within thirty days after the issuance of a final order by the Commission upon the application for rehearing, together with proof of service of a demand on the Commission to file with said court a copy of a written transcript of the record of the proceeding before it and a copy of its order and opinion, if any. The court shall have jurisdiction of the proceeding and shall have power to grant relief as it deems just and proper, and to make and enter an order enforcing, modifying, and enforcing as so modified, remanding for further specific evidence or findings or setting aside in whole or in part such order. The jurisdiction of the appellate division of the supreme court shall be exclusive and its judgment and order shall be final, subject to review by the court of appeals in the same manner and form and with the same effect as provided for appeals in a special proceeding. All such proceedings shall be heard and determined by the appellate division of the supreme court and by the court of appeals as expeditiously as possible and with lawful precedence over other matters. The grounds for and the scope of review of the court shall be limited to whether the order of the Commission and opinion, if any, is (a) in conformity with the constitution and the laws of the state and the United States. (b) supported by substantial evidence in the record or by information properly considered in the opinion. (c) within the Commission's statutory jurisdiction or authority. (d) made in accordance with procedures set forth in this article or established by rule or regulation of the Commission. (e) arbitrary, capricious or an abuse of discretion.

c. Siting Certain Fuel Gas Transmission Lines

All entities who intend to construct fuel gas transmission lines shall file with the Commission for its approval the standards and practices which will be applied to environmental management and construction of all such fuel gas transmission lines or shall file a certified statement agreeing to construct such lines in accordance with standards and practices on file and approved by the Commission.

A notice of intention to construct a fuel gas transmission line which extends a distance of less than five miles and which is six inches or less in diameter, shall be filed with the Commission and shall contain:

(a) the date on or about which the applicant intends to begin construction of the line;

- (b) a brief statement describing and locating the line;
- (c) an indication of the approved environmental management and construction standards and practices that will be followed in an effort to minimize or avoid adverse environmental impacts to the maximum extent practicable.

A copy of the notice shall be served on each municipality in which any portion of the fuel gas transmission line is to be located and proof of service shall accompany the notice filed with the Commission.

An application to construct a fuel gas transmission line which extends a distance of less than ten miles, but not less than five miles, shall be filed with the Commission and shall contain:

- (a) the information required by paragraphs (a), (b), (d) and (f) of subdivision one of section one hundred twenty-two;
- (b) the description of the ecosystem, land use, visual and cultural resources which would be affected by the line; and
- (c) an indication of the approved environmental management and construction standards and practices that will be followed in an effort to minimize or avoid adverse environmental impacts to the maximum extent practicable. A copy of such application shall be served on:

- the Department of Environmental Conservation;
- the Department of Agriculture and Markets; and
- each municipality in which any portion of the line is to be located;

Any person may file comments on an application with the Commission. The record of the certification proceeding under subdivision seven may be limited to the application, any comments filed by the parties and any report prepared by the staff of the department of public service, whether or not it acts as a party.

Upon receipt of a notice with respect to a fuel gas transmission line, the Commission shall, within thirty days or less, determine whether there is a substantial public interest requiring that the facility be reviewed in accordance with the provisions of this section. If the Commission determines that such review is not required, it shall issue a Certificate authorizing such construction. Failure to act within the thirty day period shall constitute a Certificate. If the Commission determines that such review is required, the Commission shall serve a copy of the notice on the appropriate entities. The Commission shall render a decision upon the record within sixty days from the date on which it receives an application. Where the Commission has required a hearing it may extend the time required to render a decision. In rendering its decision on a notice filed concerning a fuel gas transmission line, the Commission is required to find and determine only that the construction of a fuel gas transmission line will minimize or avoid adverse environmental impacts to the maximum extent practicable.

III. Articulation and Identification of Enforceable State Policies, Authorities and Techniques for Managing Energy Facilities and Their Impacts

State energy policies are contained in the Energy Law and State Energy Plan (see Table 1 for the relevant Energy Laws, and Appendix F for the New York State Energy Plan). In general, the policies deal with improving the reliability of the state’s energy systems; insulating consumers from volatility in market prices; reducing the overall cost of energy in the state; and minimizing public health and environmental impacts, in particular, environmental impacts related to climate change; maximizing cost-effective energy efficiency and conservation activities to meet projected demand growth. State energy policies include the following:

1. New York’s energy policy, regulatory reforms, initiatives, and programs will focus on market transformation, enabling the entire clean energy supply chain from technology developers to equipment wholesalers to consumers seeking clean energy options, to engage in a new, integrated, and self-sustaining private sector driven clean energy market. In order to accelerate market transformation, initiatives will focus on identifying, mitigating, and removing common market barriers to clean energy deployment (e.g., by reducing soft costs, for instance those related to customer acquisition, permitting, and training), enhancing data sharing and transparency efforts, supporting outreach and education, and encouraging demonstration projects.
2. One of the fundamental energy strategies will be for the State to engage with local towns, villages, and cities, low- and moderate-income communities, environmental justice communities, academia, business, and industry, with this engagement running in both directions. State agencies will provide assistance—and streamlined access to that assistance—to communities and municipalities throughout the State to enable them to develop and implement clean energy solutions that deliver the electricity, heating, water, communications, land-use, and transportation systems that each community values. By embracing a clean energy future, municipalities can achieve meaningful operating savings through energy efficiency and the deployment of other distributed energy resources (DERs). They can also become more resilient by connecting critical facilities to DERs, for instance through innovative community microgrids.
3. Government and ratepayers cannot fund the cost of New York’s clean energy transition alone. By removing market obstacles, New York’s energy policy will facilitate development of competitive markets. These markets will in turn deliver distributed energy resources and innovative energy products and services to residents, businesses, and communities across the State. New York’s energy policy will also develop price signals that will better reflect the value of clean energy to the grid, and will guide the market’s development of DERs, products, and services in ways that improve overall system efficiency (e.g., by relieving grid congestion points or shifting load profiles). New York’s energy policy will look to increase the leverage of private sector capital investment per ratepayer dollar by working through the New York Green Bank (NYGB) to develop innovative public/private partnerships and financing models that bridge clean energy finance market gaps. Enabling private capital investment to drive self-sustaining independent clean energy markets is a prerequisite to deliver true scale to the clean energy sector, which in turn is an essential component for meaningful economic development.
4. New York’s energy policy will align energy innovation with market demand. State agencies will partner with New York’s academic research institutions and the private sector to support the development of next generation clean energy technology solutions and innovative business

- and financing models, while training the next generation of talent to support the growth of the clean energy economy. New York's energy policy will also look to leverage the momentum of broader technology trends, like home automation, home security, and related tech services, to increase penetration of energy efficiency and give consumers insight into and enhanced control over their energy consumption. At the same time, state agencies will engage with the clean tech innovation sector outside of New York to help import leading and relevant solutions from elsewhere and to help export New York State solutions to receptive markets outside the State.
5. New York's energy policy aims to empower customers and enable the private sector to provide the services and energy options those customers value. New York's energy policy will enable competitive markets and encourage the entry of private firms to use transparent real-time information to deliver a range of energy related products and services. Residential, commercial, and industrial customers will have the tools to easily and efficiently manage when and how much power they will consume from the grid or distributed resources and at what cost. Energy-intensive and quality-sensitive customers such as manufacturers, university and commercial campuses, hospitals, and data centers will be able to choose to bolster the reliability and resiliency of their energy supply in order to provide business continuity and meet their varying needs.
 6. New York's energy planning will generate forecasts of demand for traditional, alternative and emerging forms of energy, and these forecasts will take into account energy conservation, load management and other demand-reducing measures which can be achieved in a cost-effective manner,
 7. New York's energy planning will include an analysis of security issues, considering both natural and human threats to the state's energy systems, including an inventory of current and future projected greenhouse emissions, and strategies for facilitating and accelerating the use of low carbon energy sources and/or carbon mitigation measures.
 8. New York's long-range energy planning objectives include the least cost integration of energy supply sources, energy transportation and distribution system and demand-reducing measures for satisfying energy supply requirements, giving due regard to required capital investments, cost, ratepayer impacts, security and diversity of fuel supplies and generating modes, protection of public health and safety, adverse and beneficial environmental impacts, conservation of energy and energy resources, and the ability of the state to compete economically.
 9. New York's energy planning will include an environmental justice analysis. Environmental justice is defined as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental, and commercial operations or policies. Environmental Justice communities have been disproportionately impacted by air pollution from fossil fuel power generation facilities and transportation infrastructure that historically have often been sited in these communities. Other impacts associated with the siting and operation of power plants include potential loss of open space, degrading of water quality, oil spills, visual impacts, and increased truck traffic. In addition, these environmental justice

communities also bear additional burdens of higher rates of diseases such as asthma, diabetes, cardiovascular disease, and childhood lead poisoning. To achieve environmental justice, energy laws must ensure that all communities enjoy equal protection from environmental and health hazards, and disenfranchised communities are afforded meaningful opportunities to understand, review, and respond to those actions and decisions that potentially impact how they live, learn, work, and play. The State will continue to promote efforts to address the negative environmental impacts that energy facilities and transportation sources have on these communities. To further the development of a robust and effective set of environmental justice-related energy policies and programs, the State will continue to examine issues such as the impacts of power generation and siting on overburdened communities, the implications of climate change and energy prices for low-income households, and enhanced public participation from environmental justice stakeholders in relevant agency planning, review and permitting processes.

10. New York's energy planning will include an assessment of the ability of urban planning alternatives, including smart growth and mass transportation improvements to reduce energy and transportation fuel demand, and an assessment of the impacts of implementation of energy plans on economic development, health, safety and welfare, environmental quality, and energy costs for consumers, specifically low-income consumers.

The State of New York has enacted laws and adopted regulations which govern the siting of certain energy uses and facilities. The basic laws and regulations are:

- New York State Energy Law Article 6: Energy Planning
- 2015 New York State Energy Plan
- New York State Public Service Law Article 10: Siting of Major Electric Generating Facilities
- New York State Public Service Law Article VII: Siting of Major Utility Transmission Facilities
- New York Codes, Rules and Regulations Title 9, Subtitle BB, Chapter III State Energy Planning Proceeding
- New York Codes, Rules and Regulations Title 6, Chapter IV, Subchapter H, Part 487 Analyzing Environmental Justice Issues in Siting of Major Electric Generating Facilities Pursuant to Public Service Law Article 10
- New York Codes, Rules and Regulations Title 16, Chapter X, Subchapter A, Parts 1000-1002 Regulations Implementing Article 10 of the Public Service Law as Enacted by Chapter 388, Section 12, of the Laws of 2011

IV. Identification of How Interested and Affected Public and Private Parties May Be Involved in the Planning Process

The Department of State, as the agency responsible for the Coastal Management Program, will ensure that coastal concerns are part of energy facility deliberations by continuing to review the State Energy Plan and any amendments thereto. It also by law receives proposals for review under Articles VII and 10 of the Public Service Law and will participate in hearings under Article VII and Article 10.

In addition, pursuant to the Waterfront Revitalization of Coastal Areas and Inland Waterways law, Department of State regulations and amendments to SEQRA regulations provide the procedural opportunities for the Department of State to undertake its required review of all actions, including energy facilities, which may affect the achievement of the coastal policies.

Before the State Energy Plan is amended, major private sector energy suppliers are required to submit comprehensive long-range plans for future operations to the New York State Energy Research and Development Authority (NYSERDA) and other State agencies. These plans are reviewed and approved by the Energy Board.

Local governments and the general public are provided the opportunity to participate as parties in Article VII and 10 proceedings and other hearings conducted pursuant to the various permitting and environmental review procedures cited above. The Department of State will also encourage local governments which develop waterfront revitalization programs to consider future energy development activities, to identify appropriate sites, and to prepare local laws or other mechanisms for dealing with new or expanding energy development.

The national interest in the planning for and siting of energy facilities was determined from national energy policy and through direct communication with appropriate federal agencies. For a more complete discussion of the national interest in energy production and transmission facilities, see Part II, Section 9, Special Program Requirements, of this document.

SHORELINE EROSION/MITIGATION PLANNING

Section 305 (b) (9) of the Coastal Zone Management Act of 1972, as amended, requires that state coastal management programs must include a shoreline erosion/mitigation planning process, the regulations for which are presented in 15 CFR 923.25:

- (1) The management program must include a method for assessing the effects of shoreline erosion and evaluating techniques for mitigating, controlling or restoring areas adversely affected by erosion.
- (2) There must be an identification and description of enforceable policies, legal authorities, funding techniques and other techniques that will be used to manage the effects of erosion as the State's planning process indicates is necessary.

As evidenced in the Flood and Erosion Hazards issue discussion (Part II, Section 5), which is incorporated by reference as part of this response, the effects of shoreline erosion and the techniques for dealing with it are of major concern to New York State. However, the State lacked a systematic basis for dealing with that concern until 1981 when the Coastal Erosion Hazard Areas legislation was enacted. The law (Environmental Conservation Law, Article 34) recognizes: the extensive damage caused by erosion in the State's coastal area; human contribution to the problem by activities which exacerbate the erosion process or by placing property where it is exposed to damage; and, that many measures taken to control erosion are costly, often ineffective, and may be harmful to other lands. The law has three principal components: delineation of the hazard areas; promulgation of regulations; and implementation.

Procedures established by the law require the Department of Environmental Conservation, in full cooperation with affected local governments, to complete a preliminary identification of erosion hazard areas of the State's coastline. Coastal erosion hazard areas are defined by Article 34 in two ways. In the first, a requisite period of protection of structures is set at 40 years. That number is then multiplied by the

annual land recession rate on lands where it is at least one foot, to define the inland extent of the hazard area. The recession rate will be measured using comparable maps and aerial photography, including 1979 photographs of the State's Great Lakes coast which were flown specifically for this purpose, and funded under the federal Coastal Zone Management Act. The second definition of erosion hazard area encompasses dunes, beaches, shoals and other features which offer natural protection to shorelands. After required public hearings and consultations, final identification of coastal erosion hazard areas will be made. Priority is being given by DEC to identifying first those areas of the coastline which are eroding at a rate of 4 feet or more annually.

Within those identified erosion hazard areas, the regulatory provisions of the legislation will apply. For activities and development in such areas, regulations promulgated under Article 34 are required to establish minimum standards and criteria including: the use of setbacks; prevention of increase in erosion; minimizing of adverse effects on natural protective features; and measures to ensure the effectiveness of control structures. The law also specifies that, when public funds are to be used for activities and development, the public benefits must clearly outweigh the long-range adverse effects. Policies 11, 12, 13, 14, 15, 16, and 17 are based on those regulatory provisions.

Article 34 is designed to give, first, each affected local government the opportunity to implement its provisions with the adoption of a local coastal erosion hazard areas law or ordinance. If a local government fails to exercise its right, the county, or finally, DEC must issue regulations for that community.

In summary, the effects of full implementation of the Coastal Erosion Hazard Areas law are all erosion hazard areas of the State's coastline will be identified and mapped; a regulatory framework govern activities and development in those areas; and all government as well as private actions and programs will be constrained by the Act.

SHOREFRONT ACCESS AND PROTECTION PLANNING PROCESS

Several regional, State, and local agencies participating in development of the Coastal Management Program identified specific sites in need of improved access for their functional or geographic areas of concern. Access sites for fishing, boating and other waterfront related activities have been identified by the Department of Environmental Conservation; the Office of Parks, Recreation and Historic Preservation; New York City Planning Commission; the Long Island Regional Planning Board; the Erie and Niagara Counties Regional Planning Board; the St. Lawrence-Eastern Ontario Commission; and individual counties participating in the program.

While most of the access site recommendations may reflect knowledge of the local area or specific functional plans, they are not based on a single coordinated statewide access planning process. The New York City Department of Planning has developed a methodology for identifying shorefront areas appropriate for improved access. The Department tabulated the nature of the access issues for 33 areas. For three of these, detailed studies were undertaken consisting of: an examination of the study area in terms of current modes of access to the shore; identification of specific shorefront access concerns based on the above investigations; and recommended actions necessary to mitigate these concerns. The remaining identified areas will also be evaluated in this manner in the immediate future.

The Office of Parks, Recreation and Historic Preservation has also inventoried recreational facility capacity and undertaken supply and demand studies which can be applied to determination of access roads.

A single procedure for identifying, on a statewide basis, public shorefront areas appropriate for access has been developed as part of the Coastal Management Program and is outlined below. This procedure utilizes, in part, various methodologies and inventories already developed by State and local agencies and the lists of specific sites needing access improvements. This procedure satisfies the shorefront access and protection planning requirements of the Coastal Zone Management Act. Its application will result in a list of the specific access improvements to which the State will give priority within financial and legal limits. An interagency advisory committee will be established to oversee operation of the procedure.

1. Identify the types of public areas to which new or increased public access is desirable and a single planning process is appropriate for determining needed additional access.
 - a. Beaches - definition of beach is as follows: A beach is a zone of unconsolidated material that extends landward from the level of lowest water to the place where there is a marked change in natural or physiographic form (first line of terrestrial vegetation) or to the upper limit reached by the highest storm waves, which is the area subject to alternate erosion and deposition of beach material. The offshore limit of a beach is the mean low water line. A beach consists of both foreshore and backshore zones. Beach elements include dry sand areas, sand dunes, and areas of reasonably graduated slope to the water. Beaches are composed of a variety of materials, including sand, gravel, or pebbles. Areas composed of other materials may function as beaches when they are used for traditional beach activities.
 - b. Fishing and hunting areas
 - c. Boat launching sites and marinas
 - d. Scenic areas of statewide significance - as defined in the scenic quality issue discussion (Part II, Section 5) of this document
 - e. Waterfront parks
 - f. The coast at large, to include other non-federal publicly-owned land
2. Inventory existing public areas to which public access is provided and/or desirable.
 - a. Beaches - inventory and map those areas which meet the definition of beach above, including identification of those in public ownership. Sources are as follows:
 - (1) Office of Parks, Recreation, and Historic Preservation Inventory of Recreation Sites
 - (2) Land Use and Natural Resource Inventory (LUNR)
 - (3) Office of General Services State Land Inventory
 - (4) New York City Coastal Management Program Report
 - (5) Nassau-Suffolk Regional Planning Board Coastal Management Program Report
 - (6) St. Lawrence-Eastern Ontario Commission Coastal Management Program Report
 - (7) State Coastal Management Program Coastal Atlas (will map all beaches)
 - b. Fishing areas - an inventory and map of sites to which the public has access for fishing purposes within the coastal area. Sources are as follows:

- (1) Office of Parks, Recreation, and Historic Preservation Inventory of Recreation Sites
 - (2) Department of Environmental Conservation's Fish and Wildlife Management Program
 - (3) Office of General Services' State Lands Inventory
 - (4) New York City Coastal Management Program Report
 - (5) Nassau-Suffolk Regional Planning Board Coastal Management Program Report
 - (6) St. Lawrence-Eastern Ontario Commission Coastal Management Program Report
 - (7) Sea Grant
- c. Boat launching sites and marinas - an inventory of all marinas and boat launching sites open to the public. Sources include all those listed under "a" above plus the Corps of Engineers, Sea Grant, and the Department of Transportation.
- d. Scenic areas of statewide significance - an inventory and map. Principal source is the Coastal Management Program Coastal Atlas, plus information from the Department of Environmental Conservation and the Office of Parks, Recreation, and Historic Preservation.
- e. Waterfront parks - an inventory and map. Sources are as follows:
- (1) Office of Parks, Recreation, and Historic Preservation's Inventory of Recreation Sites
 - (2) Coastal Management Program Coastal Atlas
- f. Coast at large - a map and inventory of areas with general access to the shore. Sources include:
- (1) Office of General Services Inventory of State Lands
 - (2) County tax maps
3. Describe the level and type of existing access at each site identified in terms of mode, capacity, and condition. Major source is the Office of Parks, Recreation, and Historic Preservation's Inventory of Recreation Sites.
4. Assess the appropriateness of the above access relative to the capacity (physical and environmental) of the site to accommodate increased access and the present and future Remand for use of the site.
5. Where increased access is appropriate, indicate the appropriate means for improving access and the agency's responsibility.
6. Establish a priority system for areas where increased access is appropriate.

SECTION 8 – SPECIAL MANAGEMENT AREAS

IDENTIFICATION AND SELECTION

The New York State Coastal Management Program has identified three categories of uses and activities which, because of their particular coastal related values, development pressures, or site specific circumstances, require detailed attention beyond the general planning and management system that constitutes the State's coastal program. The three categories of special management areas are: 1) State parks, 2) local waterfront revitalization areas, and 3) estuarine sanctuaries.

In addition to special management areas that focus on discrete geographic areas, the New York State Coastal Management Program may develop regional coastal management programs for the coastal zone of one or more of New York's several major water bodies. These regional coastal management programs will refine the State coastal program to address the specific circumstances and conditions in the coastal region.

The *Draft NYS Coastal Management Program Report*, dated March 1979,⁶³ detailed identification and selection criteria for geographical areas of particular concern. The application of these criteria resulted in the proposed designation of 97 site specific geographic areas of particular concern and four categories of generic areas. Under the management program as presented in this final Coastal Management Program most of the areas that were identified can be adequately managed through the policies and various implementation measures of the program, notably the Waterfront Revitalization of Coastal Areas and Inland Waterways law, the State Environmental Quality Review Act, Shore owners Protection Act, State Historic Preservation Act, Articles VII and VIII (now Article 10) of the Public Service Law, and the Freshwater Wetlands Act and Tidal Wetlands Act. Only the three areas mentioned above continue to require detailed and/or individual attention beyond the basic management program. State parks in the coastal area differ considerably in size, uses, and other circumstances and may require specific management programs which should be made part of the coastal management program. Each local revitalization waterfront area will have a program that, though it will adhere to common criteria, will be designed to meet the specific needs of each community. Similarly, any area designated as an estuarine sanctuary must be managed in a manner which will further federal sanctuary objectives.

A more complete description of the management of these three areas follows. Additional information including detailed regulations and guidelines are contained in appendices to this document.

STATE PARKS

Shorefront access and recreation are two of the major issues in New York State's coastal area. Public access to the coastline for recreational purposes is determined to a great extent by land ownership and land use patterns. Where coastal lands are privately owned, as is the case of most coastal lands in New York, public access is usually prohibited. In addition, the existing patterns of residential, commercial, industrial, and transportation land uses make large portions of New York's coast inaccessible or at the least severely limit access. For example, access to the Hudson River is substantially reduced because railroad lines run parallel to both sides.

While leisure time and the associated interest in recreation are increasing, physical barriers to public access persist and interest in buying coastal land for private purposes increases. Therefore, it is imperative that

existing public access be preserved, maintained, and managed and where feasible, new access areas provided so that as many people as possible can take advantage of recreational opportunities.

State parks are the public facilities that provide coastal access and water-based recreational opportunities for the largest number of New York State residents. There are 90 State parks within New York's coastal boundary that represent probably the most important link between the people and the shore. The New York State Office of Parks, Recreation, and Historic Preservation (OPRHP), as part of its comprehensive outdoor recreation program, administer these 90 State parks which are grouped into four distinct categories: linear systems, boating facilities, parks and land preserves, and historic areas. Within each of these categories are subcategories of facilities to serve all types of users.

Management Objectives

The overall management objective for State parks is to preserve and maintain these facilities so that the residents of New York State are guaranteed recreational access to the coastal area. However, four other management objectives are important, and should be considered in any specific management program for a State park:

1. Ensure first that water dependent uses and then water-enhanced uses are accommodated within coastal State parks.
2. Manage land immediately adjacent to State parks so that incompatible development does not take place or is, at least, minimized.
3. Provide the appropriate level of public access to presently undeveloped or underutilized State parks.
4. Encourage the attainment of carrying capacities in underutilized State parks.

Priority Uses

Highest priority uses within coastal State parks are those recreational activities that are water dependent or water-enhanced. The lowest priority uses are those that would be environmentally incompatible. The extent of this incompatibility will vary, of course, from park to park depending on the amount of existing development and the character of the parkland.

Priority uses of land immediately adjacent to State parks will also vary according to the types and intensity of both existing and proposed development and the nature and character of the State park. For example, in a park that has primarily been left in an undeveloped State, the highest priority development on adjacent land should be that which affords maximum protection to the natural character of the park. In a more highly developed park, adjacent land development should vary with the nature of the park.

Existing Management Authorities

1. **Office of Parks, Recreation, and Historic Preservation** - It is legislated policy of New York State (Title B, Article 3, Section 3.01 of the Parks, Recreation and Historic Preservation Law) to establish and maintain a system of State parks. State parks are administered by the New York State Office of Parks, Recreation, and Historic Preservation (OPRHP). The Office of Parks, Recreation, and Historic Preservation is presently in the final stages of developing a State Park Land Classification System. This system would examine the land capabilities of each State park area so that the type and level of appropriate development can be determined. When completed, this should give OPRHP increased capability for decision-making concerning desirable development at each of its coastal State parks.

2. **Office of General Services** - There is a great deal of un-appropriated State land throughout New York State. It could be made available for parks through a transfer of jurisdiction from the Office of General Services to the Office of Parks, Recreation, and Historic Preservation.
3. **Local Zoning** - The Office of Parks, Recreation, and Historic Preservation's ownership, administration, and policy planning powers provide adequate management authority to meet management objectives within State parks. However, OPRHP does not have power to ensure that compatible development takes place in lands adjacent to State parks. Section 13.07 of the Parks, Recreation, and Historic Preservation Law prohibits any person from erecting or maintaining any advertising sign or structure within 500 feet of the border of any State park. Other than that, control of adjacent lands is left to the local government. The individual municipalities can, through zoning and other land use controls, regulate the use of these lands.
4. **General Municipal Law** - Section 239-m of the General Municipal Law does require, however, that any proposed zoning regulation or amendment to a zoning regulation which would change the regulations applying to real property within 500 feet of the boundary of a State park must be submitted to a county planning agency (or the appropriate regional planning agency if no county agency exists) for review. If the county planning agency disapproves the zoning proposal, the municipal agency having jurisdiction in local zoning matters may proceed with the disapproved regulation only after a vote of a majority plus one in favor. In addition, a resolution must be adopted setting forth the reasons for going counter to the county recommendations.

LOCAL WATERFRONT REVITALIZATION PROGRAMS

As part of the State's Coastal Management Program, coastal localities are encouraged to use their resources and authorities to develop detailed programs for the revitalization of their waterfronts and the protection of coastal resources. While the State can promote development and provide for protection of critical resources and environments, the Waterfront Revitalization of Coastal Areas and Inland Waterways law recognizes that local governments, with the assistance and cooperation of the State, are in the best position to determine what specific activities will take the best advantage of their local circumstances. To do this, the Act provides incentives for local governments to develop waterfront revitalization programs. It also sets up a process for cooperation between all levels of government. The objective is a detailed local program to which all levels of government are committed.

The general requirements for development and the content of an approved local waterfront revitalization program are described below. The more detailed guidelines that will be used by the Department of State in approving a local program are contained, in draft form, in an appendix to this document. These requirements are based on the Waterfront Revitalization of Coastal Areas and Inland Waterways law, which describes in some detail both the process for development and the content of a local waterfront revitalization program.

Procedure for Program Development and Implementation

As to process, the Act provides that any local government or two or more local governments acting jointly may prepare a waterfront revitalization program and seek its approval by the Secretary of State. The Department of State will provide technical and financial assistance to local governments wishing to prepare waterfront revitalization programs. Guidelines have been prepared by the department to aid localities in the preparation of their waterfront programs. More importantly, as required by the Act, the Department will actively work with each locality to facilitate the necessary consultation and coordination among local,

county, regional, State and federal agencies and with community organizations in connection with the preparation of a local waterfront program. In addition, the Department of State will provide, as appropriate, to each participating locality, maps, data, model implementation mechanisms and technical advice.

Local programs are to include procedural as well as substantive elements. Among these are requirements that the program be long range, that the local government have adequate authority and the ability to implement the program, and that the program identify specific State actions including permit, funding, construction, and planning programs necessary for its implementation. The program must be approved by the legislative body and the chief executive officer of the municipality before it is submitted to the Secretary of State.

Program Approval

Before approving a local waterfront revitalization program, the Secretary of State will consult with affected State and federal agencies. The Secretary cannot approve a local program if he finds it conflicts with an existing State or federal policy. When a conflict is found, the Secretary will attempt to resolve the differences.

Within sixty days of approving a local waterfront revitalization program, the Secretary will identify specific State permit, financial assistance, acquisition and capital construction programs likely to affect the achievement of the local program.

State agency programs so identified will, to the maximum extent practicable, be undertaken in a manner consistent with the approved local waterfront program. To assure the consistency of State actions with a local program, existing review and notification procedures, particularly SEQRA and A-95, will be utilized. Using these and other procedures if necessary, State agencies will provide local government with adequate information on a proposed action. The municipality is expected to evaluate proposed actions and identify conflicts with its approved local program. Once notified by the locality of the potential conflicts, the Secretary will confer with the State agency and the local government to modify the action so that it will be consistent with the approved waterfront revitalization program.

The Secretary is also required by the Act to work with State agencies and seek additional means of implementing approved local waterfront programs. Where a local government has identified program elements which depend upon other than local funds and actions, the Secretary will consult with the appropriate State and federal agencies to explore the possibilities or programming of additional assistance that would further the implementation of the local program.

Program Content

As to the content of a local waterfront revitalization program, the Department of State guidelines are based on Sections 912, 915.4 and 915.5 of the Act. First, all local programs must be consistent with and work towards the achievement of the policies contained in Section 912. These policies are:

1. To achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources, while preventing the loss of living marine resources and wildlife, diminution of open space areas or public access to the waterfront, shoreline erosion, impairment of scenic beauty, or permanent adverse changes to ecological systems.

2. To encourage the development and use of existing ports and small harbors including use and maintenance of viable existing infrastructures, and to reinforce their role as valuable components within the State's transportation and industrial network.
3. To conserve, protect and where appropriate promote commercial and recreational use of fish and wildlife resources and to conserve, and protect fish and wildlife habitats identified by the Department of Environmental Conservation as critical to the maintenance or re-establishment of species of fish or wildlife. Such protection shall include mitigation of the potential impact from adjacent land use or development.
4. To encourage and facilitate public access for recreational purposes.
5. To minimize damage to natural resources and property from flooding and erosion, including proper location of new land development, protection of beaches, dunes, barrier islands, bluffs and other critical coastal features and use of non-structural measures, whenever possible.
6. To encourage the restoration and revitalization of natural and human-made resources.
7. To encourage the location of land development in areas where infrastructure and public services are adequate.
8. To conserve and protect agricultural lands as valued natural and ecological resources which provide for open spaces, clean air sheds and aesthetic value as well as for agricultural use.

The guidelines for determining whether a local program is consistent with, and furthers the achievement of these policies, reflect the elaboration of these policies found in the comparable policies of the Policies Section of this document. These guidelines are to be found in Appendix B of this document.

In addition to being consistent with and furthering the policies of the Act, a local waterfront revitalization program must focus on each of the following specific activities (Section 914.5) to an extent commensurate with the particular circumstances of that local government. That the more relevant the use or activity is to the circumstances revealed in a community's analysis of its coastal area, the higher the priority for such use or activity will be, and the less relevant the use or activity, the lower its priority.

- a. The facilitation of appropriate industrial and commercial uses which require or can benefit substantially from a waterfront location, such as but not limited to waterborne transportation facilities and services, and support facilities for commercial fishing and aquaculture.
- b. The increased use of and access to coastal waters and the waterfront for water-related activities such as boating, swimming, fishing, walking, and picnicking.
- c. The promotion and preservation of scenic, historic, cultural and natural resources as community amenities and tourist designations.
- d. The strengthening of the economic position of the State's major ports and small harbors.
- e. The reuse of existing infrastructure and building stock and the removal of deteriorated structures and unsightly conditions that have negative effects upon the waterfront area and adjacent neighborhoods.
- f. The application of local aesthetic considerations in the design of new structures and the redevelopment of waterfront sites.

- g The protection of sensitive ecological areas, including but not limited to dunes, tidal and freshwater wetlands, fish and wildlife habitats, and the protective capability of coastal land features. Such protection will assure that land use or development will not affect such areas.

Alternatively, a community may prepare a Local Waterfront Revitalization Program which addresses a portion or component of a Local Waterfront Revitalization Program, or a geographic area of its waterfront, provided that the program constitutes a discrete and cohesive, yet comprehensive, treatment of the subject or subjects addressed, which may be related to environmental, social, regional growth management, or economic conditions.

The guidelines for determining whether a local government has adequately incorporated these activities in its program are based on an analysis of the conditions, problems, and opportunities that exist along the community's shore, and that can in good part, be successfully addressed with the resources of that community. The community will undertake the analysis as a preliminary step to the development of a local waterfront program. Guidelines for local programs will require that these activities be undertaken in a manner that is consistent with the program policies as described in this document.

Finally, local program guidelines include the requirement that a program address the following items identified in the legislation (Section 915.4):

- a. Boundaries of the waterfront area;
- b. An inventory of natural and historic resources of the waterfront area to be protected;
- c. A Statement of the goals and objectives of the program; and
- d. Identification of the uses, public and private, to be accommodated in the waterfront area.

Beyond the LWRP special management areas described above, special management areas may be identified where intermunicipal issues require a concerted and cooperative effort of the affected local governments and the State. Also certain issues affecting discreet areas within a coastal municipality may require focused and detailed management. Therefore, several other types of special management areas may be identified; these are described below.

Centers of Maritime Activity

Maritime centers are a discrete portion or area of a harbor or bay that is developed with, and contains concentrations of, water dependent commercial and industrial uses or essential support facilities. The harbor or bay area is a center for waterborne commerce, recreation, or other water dependent business activity, and may be an important component of the regional transportation system.

These areas generally exhibit the following characteristics:

- Concentrations of water dependent commercial or industrial uses.
- Sheltered locations and suitable hydrologic conditions, such as sufficient water depth and good flushing.
- Adequate existing navigation channels, anchorage and turning basins, piers and docks, and land-based infrastructure, e.g., highway or rail connections, essential for the operation of water dependent commercial and industrial uses; if needed, new infrastructure could be provided.

- Physical conditions meet the unique siting and operational requirements of most water dependent commercial and industrial uses to ensure the efficient and effective operation of water dependent uses.
- The center is in close proximity to central business districts where commercial uses can be located that complement or support water dependent uses, but which are inappropriate for a waterfront location.
- Lack of conflict with high value natural resources, such as beaches, dunes, or bluffs; wetlands; shellfish beds, bird habitat or other fish and wildlife habitat; or exceptional surface water quality.

The priority uses to be encouraged in these areas include water dependent commercial, industrial, and recreational uses and compatible water-enhanced uses. Lowest priority uses are those that are incompatible with water dependent uses and the functioning of the maritime center.

Waterfront Redevelopment Areas

A waterfront redevelopment area is part of, or near, a business district and contains blighted or underutilized properties which are adequate in size to accommodate significant redevelopment. These areas may contain brownfields which are abandoned, vacant, or unused sites where redevelopment and productive reuse has been delayed indefinitely by real or perceived contamination. In their geographic scope, waterfront redevelopment areas are generally a discrete area of a community, not the entire community.

The characteristics of waterfront redevelopment areas include: (1) urban waterfront areas; (2) locations where redevelopment serves as a catalyst for the reclamation of a blighted Or underutilized area or improves a deteriorated condition; (3) areas where infrastructure and transportation facilities exist; and (4) locations where redevelopment can advance regional objectives by improving public access, retaining and expanding water dependent uses, or facilitating new economic activities appropriate to the region.

Within waterfront redevelopment areas, redevelopment actions should result in a majority of the following: a restored and revitalized waterfront or adjacent inland area; a strengthened local and regional economy through the development of commercial, industrial, and residential uses; improved waterfront recreation opportunities, public access, or dockage; improved views to the waterfront; restored and preserved historic sites; improved environmental quality; enhanced community character and sense of place; and enhanced visiting pleasure.

The following circumstances are indicative of what is required for successful and appropriate development:

- **Community Initiative and Commitment**
The community demonstrates initiative and commitment to undertake and follow through on major redevelopment projects to improve the area. The local government demonstrates an interest in, and commitment to, significantly improving the community's waterfront or business district through an expression of one or more of the following: citizen support and consensus; plans which demonstrate sound economic development and land/water use objectives; or preparation of preliminary waterfront inventories and design plans.
- **Local Planning**
The community has an approved Local Waterfront Revitalization Program or is actively preparing a Local Waterfront Revitalization Program... A Local Waterfront Revitalization Program can provide the local comprehensive land use planning context for redevelopment.

- **Adequate Land and Water Use Controls**
The community has, or will have in place, adequate land and water use controls to manage the use, density, and location of development. These controls are necessary to ensure that the size, scale, and intensity of uses generated by redevelopment are appropriate and compatible with the landside and waterside character of the community.
- **Land and Water Use Optimization**
New development will generally improve the environmental quality of the area. New development will make optimal use of the area's land and water resources which include the built and natural environments, land and water uses, community character, and infrastructure, with particular attention to providing water dependent and water-enhanced uses.
- **Infrastructure**
Infrastructure and transportation systems exist which are adequate to service the proposed redevelopment. If the existing systems are inadequate, they can be repaired or upgraded to satisfactorily service the intended redevelopment.
- **Economic Growth**
Opportunities exist to stabilize or improve the local and regional economy through redevelopment projects. The area can accommodate a significant increment in growth and development.
- **Opportunities To Restore and Redevelop**
Sufficient development demand exists which can be channeled to areas for redevelopment. These development pressures can be used as opportunities to restore and redevelop significant blighted or underutilized areas, buildings, land, waterfronts, or neighborhoods, and to remediate environmental problems through appropriate redevelopment.
- **Public Access**
Public access can be improved by enhancing existing public access or by establishing new public access. Opportunities exist to establish: public open spaces on the waterfront which allow a wide range of recreational uses, waterfront recreation facilities and features to attract people to the waterfront, or an access circulation system that links waterfront areas and the business district to the waterfront
- **Community Needs**
The area to be redeveloped will serve community needs as an activity center for a range of cultural, living, employment, recreational, and educational opportunities. The redeveloped waterfront can be established or improved as a place for people to gather, socialize, recreate, or work. Redevelopment will result in the addition of new public or semi-public facilities or improvements to existing facilities.
- **Regional Significance**
The area can accommodate a significant level of new development and is, or has the potential to be, a waterfront area of regional or statewide significance. Redevelopment in the area will make major contributions to the region for retention or expansion of water dependent uses or expansion of economic activities appropriate to the region.

- **Environmental Improvement**
Redevelopment will result in environmental improvement by remediating brownfields, improving stormwater management, and improving visual quality.

The priority uses for waterfront redevelopment areas are those that are identified in a redevelopment plan, and will improve the area economically, visually, and environmentally. Lowest priority uses are those that are not identified in the plan as permitted or desirable.

Regionally Important Natural Areas

Certain areas of the state's coast are characterized by an array of smaller, natural ecological communities that together form a significant landscape of environmental, social, and economic value to the people of New York.

These regionally important areas may warrant special management attention if they exhibit the following characteristics:

- The area contains significant natural resources.
The natural resources of the area are significant to the coastal region if they contain assemblages or outstanding examples of natural ecological communities; fish or wildlife habitat; endangered, threatened, or rare plants or plant communities; or significant coastal geologic features. Significance is further determined by the cultural value or the historic or present-day human use made of the natural resources. Although development may exist in an area that is a regionally important natural area, it would have a preponderance of significant natural resources.
- The resources are at risk.
Risk is determined by the degree to which the area's natural and related cultural resources have been subject to, or are likely to be subject to, primary, secondary, and cumulative negative impacts associated with existing and new development or people's activities that place ecosystem viability and, consequently, people's quality of life, at risk.
- Additional management measures are needed to preserve or improve the significant resources, or sustain their use.
- Finally, an area with significant resources that are found to be at risk must require additional management measures beyond those currently available to maintain or improve those resources and the viability of the ecological complex within which they function.

Priority uses for regionally important natural areas are those that are compatible with sustaining and improving ecosystem viability and natural resources. Lowest priority uses are those that would have a significant adverse impact on ecosystem viability and natural resources.

Small Watersheds

Small watersheds may also warrant special management attention to improve water quality through a comprehensive program to reduce non-point pollution. These programs would include a significant embayment or reach of a river reduced by non-point pollution and where the municipalities that comprise the watershed wish to work cooperatively to reduce non-point pollution.

Priority uses are those that will not impact or have minimal impact on the upland drainage basin including sub-basins, tributaries, and wetlands of the small watershed. Lowest priority uses are those that would have

a significant adverse impact on the upland drainage basin including sub-basins, tributaries, and wetlands of the small watershed.

Estuarine Sanctuaries

The Estuarine Sanctuary Program was established under Section 313 of the federal Coastal Zone Management Act of 1972, as amended, in response to the findings of the National Estuarine Study which documented the awesome and rapid destruction of the Nation’s estuaries. The expressed purpose of this program is to identify acquire and preserve estuarine areas which are still reasonably natural systems so that these areas can then function as natural field laboratories where scientists can conduct long-term studies and educational programs. Through this program, the federal government provides grants on a 50:50 matching basis to acquire, develop and manage such estuarine areas as sanctuaries.

Uses of estuarine sanctuaries are intended to serve objectives such as the following:

- To gain a more thorough understanding of ecological relationships within the estuarine environment;
- To make baseline ecological measurements;
- To serve as a natural control in order to monitor changes and assess the impacts of human stresses on the ecosystem;
- To provide a vehicle for increasing public knowledge and awareness of the complex nature of estuarine ecosystems, their values and benefits to humans and nature, and the problems confronting them; and
- To encourage multiple use of the estuarine sanctuaries to the extent that such usage is compatible with the primary sanctuary purposes of research and education.

New York State’s Proposal

In August, 1982 New York State submitted its application for an acquisition grant for purposes of creating the Hudson River Estuarine Sanctuary. The acquisition grant request to NOAA for \$375,000, matched by an equivalent amount of State funds and services, would be used for establishment of a 4,130 acre sanctuary of which potentially 382 acres of wetlands, waters and shoreline would be purchased and to develop or renovate facilities at two or more of the four Hudson River sites. These facilities (i.e., buildings, roads, parking lots, trails, and boardwalk) will be used to accommodate research activities, educational programs, and visitors. The great majority of land within the proposed sanctuary boundaries is already publicly owned or under negotiation for public acquisition under pre-existing programs. The chief importance of establishing the proposed sanctuary would be the development of a coordinated program of research and education that would not be otherwise realized.

The composition of real property within the proposed sanctuary is as follows (acreages are approximate):

<u>Stockport</u>	Total area	1,149 acres
Currently publicly owned		692-804 acres
Proposed for acquisition		152-264 acres
<u>Tivoli</u>	Total area	1,481 acres
Currently publicly owned		1,436 acres
Under negotiation		45 acres

<u>Iona Island</u>	Total area	556 acres
Currently publicly owned		556 acres
Proposed for acquisition		0 acres
<u>Piermont Marsh</u>	Total area	934 acres
Currently publicly owned		871 acres
Under negotiation		73 acres

The total area of all four sites is 4,130 acres. Of this, 2,860 acres are wetlands and shallows, comprising 13% of the Hudson River Estuary’s total area of wetlands and shallows (less than 6 feet deep at low tide).

Estuarine sanctuary research programs would emphasize ecosystem level understanding of the Hudson Estuary and especially its wetlands and shallows, as well as applied concerns of coastal management including the management of fish, game and fur resources, vegetation, endangered and rare species, and the reduction and mitigation of human impacts on the coastal zone. Much research has been done on the Hudson River Estuary, but efforts have generally been fragmented and there are many serious gaps in the knowledge needed to effectively manage the Estuary. The proposed Hudson River Estuarine Sanctuary would help to coordinate and unify Hudson River research and to provide information to coastal managers at all levels of government and the private sector with the goal of wise resource management.

The proposed estuarine sanctuary sites contain a variety of fauna and flora and estuarine habitats representative of the Hudson River Estuary, and are located within easy reach of millions of New York State and greater New York City area residents. The proposed sanctuary would provide an opportunity for many to learn more of the estuary’s geology, ecology and resources. Estuarine sanctuary funds would be used to develop exhibit space at the Bear Mountain Trailside Museums complex near Iona Island Harsh for Hudson Estuary related exhibits; this complex is visited by over 600,000 people each year. Funds would also be used to set up facilities at or near the Tivoli Bays site for educational exhibits and for research work. Additionally, selected programs such as guided field trips, self-guided trail brochures, and educational media available to public groups and schools on loan could be developed.

Management of the Proposed Hudson River Estuarine Sanctuary

The NYS Department of Environmental Conservation will administer the proposed sanctuary and will be directly responsible for the content and structure of the sanctuary’s management plan, the expenditure of program funds, and the formulation and implementation of general program elements (such as research programs and educational programs). A Sanctuary Steering Committee comprised of representatives of the five State agencies involved in the sanctuary: Department of Environmental Conservation (DEC), Palisades Interstate Park Commission (PIPC), the Office of Parks, Recreation and Historic Preservation (OPRHP), the Department of State (DOS), and the Office of General Services (OGS) has been formed. The Committee will guide DEC on issues related to the formulation and implementation of the sanctuary’s management plan, the expenditure of program funds, and formulation and implementation of general program elements. Adoption of the Sanctuary Management Plan is subject to the unanimous approval of the Steering Committee. Consistent with the management plan, the State agencies will exercise prerogatives and make decisions regarding use of lands to which they hold title.

A Memorandum of Agreement, signed by the agencies represented on the Steering Committee, has been appended to the Final Environmental Impact Statement. The Memorandum of Agreement outlines interagency arrangements for the administration and management of the sanctuary, and expresses the agencies’ agreement to carry out the management plan.

Three citizens' advisory groups (Columbia, Dutchess, and Rockland Counties), representing local government and sanctuary user groups, will act as the Sanctuary Advisory Committee and make recommendations to the Steering Committee. The Advisory Committee will channel public support and criticism to the Steering Committee.

Implementation of the Hudson River Estuarine Sanctuary will be coordinated with the State's Coastal Management Program by virtue of three separate mechanisms. First, DOS staff will serve on the Steering Committee which will perform the duties described above, most important being its role in assisting with the development, and ultimately providing approval of the Management Plan for the Hudson River Estuarine Sanctuary. The Management Plan will set forth compatible and non-compatible uses for the Sanctuary. Furthermore, it will provide direction for future research and education activities to be conducted in the Sanctuary.

Secondly, the Department of State, as the State's lead agency for the Coastal Management Program, is responsible for review of federal consistency determinations to be made by federal agencies relative to their direct actions. By this mechanism, the Department of State can help assure that the objectives of the Hudson River Estuarine Sanctuary Management Plan are not preempted by the actions by federal agencies.

Finally, coordination of the two Programs will be reinforced by the State consistency provisions found in Regulations (19 NYCRR, Part 600) pursuant to the Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42). The direct actions of State agencies within Sanctuary boundaries must be found to be consistent with the policies set forth in those regulations.

AREAS FOR PRESERVATION OR RESTORATION

The Coastal Zone Management Act requires that "the management program make provisions for procedures whereby specific areas may be designated for the purpose of preserving or restoring them for their conservation, recreational, ecological, or aesthetic values (Section 306 (c) (9))". These same regulations further specify that standards and criteria must be developed and applied by the state in designating these areas.

The general planning and management program in Section 6 contains several policies and criteria that will result in the identification of specific areas to be preserved or restored because of their conservation, recreational, ecological, or aesthetic value. New York State has determined that significant fish and wildlife habitats, significant scenic areas, and estuarine sanctuaries will be proposed as Areas for Preservation or Restoration.

Criteria

The policies on protection of habitats and scenic areas contain detailed criteria for identification of habitats and scenic areas (cf. Policy 7 A. a-e and Policy 25 A., respectively). Estuarine sanctuaries have been identified as special management areas in part because of the need to preserve such areas; criteria for their identification are found in the discussion of special management areas.

Significant Coastal Fish and Wildlife Habitats

Significant Coastal Fish and Wildlife Habitats are discrete areas that are most valued for their wildlife habitat value as they support important fish and wildlife populations and merit special protection (see Policy 7).

The following criteria are used to identify Significant Coastal Fish and Wildlife Habitats. The significance of a habitat increases to the extent the habitat could not be replaced if destroyed. One or more of the following criteria must be met:

- The habitat is essential to the survival of a large portion of a particular fish or wildlife population.
- The habitat supports populations of species which are endangered, threatened or of special concern.
- The habitat supports populations having significant commercial, recreational, or educational value.
- The habitat exemplifies a habitat type which is not commonly found in the state or in a coastal region.

Priority uses are those that will not impact or have minimal impact on habitat values and natural resources. Lowest priority uses are those that would have a significant adverse impact on habitat values and natural resources.

Scenic Areas of Statewide Significance (SASS)

A Scenic Area of Statewide Significance is defined as:

An area that encompasses unique, highly scenic landscapes that are comprised of geological features, water bodies, vegetation, historical and cultural features, and views and which are accessible to the public and recognized for their scenic quality.

The following criteria are used to identify Scenic Areas of Statewide Significance. One or more of the following criteria must be met:

- The area exhibits, alone or in combination, the following characteristics:
 - (i) unusual variety of major components;
 - (ii) unusual unity of major components
 - (iii) striking contrasts between lines, forms, textures, and colors or
 - (iv) an area generally free of discordant features which due to siting form, scale, or materials, visually interrupt the overall scenic quality of the resource.
- The area is unique in the region or the State's coastal area.
- The area is visually and physically accessible to the general public.
- The area is widely recognized by the general public for its visual quality.

Priority uses are those that are, or can be designed and sited to be, compatible with protecting the integrity of the scenic area. Lowest priority uses are those that are incompatible with protecting the integrity of the scenic area.

Criteria for the Preparation of Special Management Area Plans for Developed Areas

The following criteria have been established to assist in determining when a special area such as maritime centers and waterfront redevelopment areas requires the development of a special management area plan. Special management plans will only be developed and approved after consultation with potentially affected local, state, and federal agencies.

- **Resource Availability**
Adequate program staff and funding must be available to undertake the preparation of the plan.
- **Local Commitment**
Local leadership must be committed to undertake and implement the plan and there is strong public support for the planning project. Commitment can be demonstrated through local resolution, cooperative municipal arrangements, and the provision of local resources to help with preparation and implementation of the plan.
- **Partnerships**
The community has demonstrated a positive record of establishing public/private partnerships to carry out and implement planning and redevelopment projects.
- **Issues and Opportunities**
An assessment of the planning area indicates that certain economic or land use issues and opportunities exist that warrant the preparation of a special management area plan to ensure the issue is adequately addressed or to take full advantage of the opportunity.

Criteria for the Preparation of Special Management Area Plans for Natural Resources

The following criteria have been established to assist in determining when a regionally important natural area, significant coastal fish and wildlife habitats, or small watersheds requires the development of a special management area plan. Special management area plans will only be developed and approved after consultation with potentially affected local, state, and federal agencies.

- **Resource Availability**
Adequate program staff and funding must be available to undertake the preparation of a natural resource management plan.
- **Local Commitment**
There must be local commitment to cooperate in preparation and implementation of a natural resource management plan. Commitment can be demonstrated through local resolution, cooperative municipal arrangements, and the provision of local resources to help with preparation and implementation of the plan.
- **Resources at Risk**
Habitat function and viability or water quality is at risk from immediate or imminent development or poor land use practices. Habitat function and viability is in a condition of ongoing or chronic degradation due to human influenced factors, such as continued or increased stormwater loadings, continued or increased rate of buffer encroachment or loss, and continued or increased decline of key indicator species including species or guilds of species important to the economy of an area or district.
- **Technical Feasibility**
Adverse impacts, degradation, and other impediments to a habitat's ability to function and remain viable must be well documented and successful methodologies must exist to address or correct the problem(s).

Criteria for the Preparation of Special Management Area Plans for Scenic Areas

The following criteria have been established to assist in determining when a scenic area of statewide significance requires the development of a special management area plan. Special management area plans

will only be developed and approved after consultation with potentially affected local, state, and federal agencies and their policies.

- **Resource Availability**

Adequate program staff and funding must be available to undertake the preparation of the plan.

- **Local Commitment**

Local leadership must be committed to undertake and implement the plan and there is strong public support for the planning project. Commitment can be demonstrated through local resolution, cooperative municipal arrangements, and the provision of local resources to help with preparation and implementation of the plan.

- **Resources at Risk**

Scenic resources are at risk from immediate or imminent development or poor land use practices that are likely to cause a significant adverse impact that, once undertaken, cannot be mitigated or reversed.

Procedures

The procedure by which significant fish and wildlife habitats and scenic areas will be designated is as follows:

1. DEC and DOS will jointly investigate and analyze potential areas;
2. And:
 - a. DEC will identify those areas which are critical to the maintenance or reestablishment of a species of fish or wildlife;
 - b. DOS, following consultation with DEC and OPRHP, will identify scenic areas of statewide significance;
3. Public comment, including that of federal and State agencies and affected local governments, will be solicited on the significance of the areas and accuracy of associated data, maps, and other supporting information;
4. After consideration of any comments received, the Secretary of State will add these areas to the official Coastal Area Map.

Procedures for designating estuarine sanctuary candidates are referenced in the discussion on Special Management Areas.

SECTION 9 – SPECIAL FEDERAL PROGRAM REQUIREMENTS

INTRODUCTION

Several federal program requirements warrant special discussion due to their particular subject matter and role in a State’s coastal management program. They are the requirements pertaining to national interest, uses of regional benefit, federal consistency and public participation

State must demonstrate that in the development of its program, adequate consideration was given to various types of facilities which may locate in coastal areas and are of interstate or national concern. In addition, the State’s management program must ensure that consideration of such facilities will be continued throughout its implementation phases. (15 CFR 923.52)

There are some types of land and water uses and facilities which are of benefit to several coastal communities, or for that matter, an entire region. Some of these uses may be subject to governmental regulations which could prevent their siting at coastal locations. A State’s management program must identify uses and facilities of regional benefit and demonstrate how they would not be unreasonably restricted or excluded (15 CFR 923.12). It should be noted that these uses and facilities may be considered of national interest.

A State’s coastal management program must contain the procedures that will be followed by the State and federal agencies in order to implement the federal consistency requirement contained in the Coastal Zone Management Act of 1972, as amended. These procedures are intended to help a State achieve its coastal policies (15 CFR 923.53).

Finally, a coastal State must ensure that State agencies, local governments, various interest groups and the general public are afforded full opportunity to participate in the development of its management program (15 CFR 923.55). The preparation and distribution of program information and public meetings and workshops are the common means for addressing this requirement.

NATIONAL INTEREST

The federal Coastal Zone Management Act requires State programs to provide “adequate consideration of the national interest involved in planning for, and in the siting of, facilities which are necessary to meet requirements which are other than local in nature” (Section 306 (c) (8)). In giving adequate consideration to such facilities, State programs must also assure that “natural resource considerations of a national nature enter into the assessment of the demand for the location needs of particular types of facilities” (see 15 CFR 923.52 (c) (4)).

New York State’s coast possesses natural resource, historic, scenic, recreation, defense and broad-ranging economic values which are of importance not only to the State, but to the Nation. Certain development actions which could affect these coastal values were examined during the preparation of the Coastal Management Program to ensure that sufficient attention was given to various national interests.

New York’s Coastal Management Program assures continued protection of natural resources of more than State significance through existing legislation, program policies and procedures, and special management areas. The State’s Program includes detailed consideration of coastal resources, including water, wetlands

and adjacent areas, fish and wildlife habitats, erosion hazard areas (including barrier islands and beaches), agricultural lands, historic and cultural resources, and scenic areas. At the same time, the Program also recognizes the critical need for development of certain facilities which depend upon and affect the various coastal resources.

For the purposes of this Program, national defense, energy production and transmission, recreation, and transportation facilities are considered to be of national interest. For each type of facility, the following information is provided: (1) sources relied upon for description of national interest; (2) descriptions of national interest in above facilities; (3) description of how the CMP considers the national interest in such facilities; and (4) the process for continued consideration of the national interest.

National Defense Facilities

Through direct communications with the various branches of the U.S. Department of Defense and analyses of the policy papers issued by its agencies, it was determined that areas of national defense interest include: (1) the accurate identification of all lands owned or leased by the military; (2) the maintenance of transportation facilities within coastal areas at levels that would ensure optimum military mobility; and (3) the need to provide new or expand existing military facilities.

Military facilities in New York's Coastal Area are not substantial in size or number. Department of Defense (DOD) lands and facilities in the coastal area are listed in Appendix D. While the State's Coastal Management Program does not apply to federally-owned lands, including those under the jurisdiction of DOD, it still recognizes the paramount importance of military facilities not only for national defense but also for their contributions to the economic, educational and cultural life of the Nation and State. Therefore, New York's Program contains no policy that contradicts the basic justification for new or expanded military facilities. It is also recognized that any new or expanded national defense facility can be sited at any location under the eminent domain authority of DOD.

In the future, defense needs and other coastal interests could be in conflict if: increased public access to the coast would interfere with the military functions of defense installations; new defense facilities were planned for sensitive ecological areas; or, off-site transportation improvements were necessary for the continued operation of a military facility.

New York State will seek to prevent serious conflicts between National defense interests and Coastal Management Program concerns by using, if available, the existing A-95 review process of its successor to comment on the funding of proposed military projects which affect the coastal area of the State. Through this process, the Department of State will suggest reasonable mitigation measures and/or alternative sites, if appropriate, so that DOD activities will be conducted in a manner which is consistent to the maximum extent practicable with the State's Program.

Energy Production and Transmission Facilities

Many energy facilities are already situated in the State's coastal area, including steam electric generating plants, transmission lines, oil storage tanks and LNG facilities. The Program's policies on energy are in accord with existing State laws and plans which address energy needs and environmental quality in a comprehensive manner.

The State has demonstrated its recognition of the national interest in energy facilities by the number and scope of facilities already located in or planned for New York's coastal area. When New York's Coastal

Management Program was initially approved, energy capacity data was included as baseline data, and subsequently updated. The total 1981 capacity for New York State utilities was 30,331 megawatts. This was produced by the following types of existing facilities, (1) oil - 100 units, (2) hydro - 17 units, (3) gas - 6 units, (4) coal - 30 units, and (5) nuclear - 5 units. In addition, other facilities are in various stages of planning and development: (1) 2 nuclear - under construction, (2) 1 coal - under construction, (3) 3 coal - licensed to be constructed, and (4) 1 pumped storage - licensed to be constructed. When operating, these facilities were expected to produce 5,868 megawatts. Finally, 15 plants were proposed to be converted to coal to produce 3,685 megawatts. As a result, by 1990, New York's CO₂ annual emissions from fossil fuel combustion were 207.7 Million Metric Tons CO₂ (MMTCO₂).⁶⁴

The total 2012 electrical energy generating capacity for New York State utilities was 43,656 megawatts produced by a total of 948 facilities. This was produced by the following types of existing facilities: oil (petroleum) - 118 units generating 5,709 megawatts, Hydroelectric - 381 units generating 4,657 megawatts, Natural Gas - 274 units generating 21,421 megawatts, Coal - 24 units generating 2,950 megawatts, Nuclear - 6 units generating 5,708 megawatts, Pumped Storage - 16 units generating 1,240 megawatts, Solar Thermal and Photovoltaic - 1 unit generating 32 megawatts, Wind - 20 units generating 1,399 megawatts, Wood and Wood Derived Fuels - 3 units generating 97 megawatts, Other Biomass - 103 units generating 415 megawatts, and Other Sources - 2 units generating 28 megawatts. Energy generating capacity under development for New York State in 2012 anticipated an additional 256 megawatts from 16 facilities. This additional capacity was anticipated to be generated from: Solar Thermal and Photovoltaic - 1 unit generating 1 megawatt, Wind - 5 units generating 239 megawatts, and Other Biomass - 10 units generating 16 megawatts.⁶⁵ As a result, by 2013, New York's CO₂ emissions from fossil fuel combustion were 166.72 Million Metric Tons CO₂ (MMTCO₂).⁶⁶

Article 6 of the State's Energy Law is the principal authority under which the national interest in energy is considered. This law requires the preparation and adoption of a statewide energy plan which establishes the State's future energy requirements.

In determining these requirements, consideration must be given to factors which relate to reducing the State's and the Nation's dependence on foreign oil and also to developing renewable sources of energy. Factors include: the extent to which energy conservation measures and new energy technologies may affect the State's energy requirements; the extent to which indigenous energy resources may contribute to meeting the State's requirements.

The State Energy Planning Board may adopt an amendment to the state energy plan if there has been a material and substantial change in fact or circumstance since the most recent plan was adopted. Additionally, every four years, the State Energy Planning Board will adopt a state energy plan, however, the board may adopt such a plan more frequently for good cause shown. The Board shall prepare biennial reports, every second year following the issuance of the final state energy plan, including a discussion and evaluation of the ability of the state and private markets to implement the policies, programs, and other recommendations as found in the state energy plan, and recommendations for new or amended policies as needed to continue successful movement towards implementation and realization of such policies and programs. Thus again the national interest will be considered.

Under Article 5 of the Energy Law, the New York State Energy Research and Development Authority must also formulate and revise a State energy conservation plan to be submitted pursuant to the federal Energy Policy and Conservation Act of 1975. In addition, any action requiring preparation of an EIS under

the State Environmental Quality Review Act must be reviewed as to its effects on the use and conservation of energy.

Under Article 6 of the Energy Law, every four years, the State Energy Planning Board shall undertake supplemental studies for future energy planning, including a study of the overall reliability of the state's electric transmission and distribution system. The Board will prepare a report on the study's findings and legislative recommendations, and transmit such report along with the reliability study to the governor, the speaker of the assembly, the temporary president of the senate, the chair of the assembly energy committee, and the chair of the senate energy and telecommunications committee. The Board will consult with entities that have resources and expertise to assist in such study, including, the Department of Public Service, the Long Island Power Authority, the Power Authority of the State of New York, the bulk system operator (BSO), and any other electric company or trade organizations. The study shall include an assessment of each of the following:

- The current and projected reliability of the electric power system over the term of the planning period, with specific focus on transmission systems and distribution systems within the state. The assessment shall examine workforce utilization and the investment in infrastructure, including capital improvements, expansions, and maintenance;
- Potential impacts on distribution system reliability from distributed electric generation, especially generation using renewable or innovative energy resources; energy conservation and efficiency; load control and peak saving measures; corporate reorganization of electric utilities; performance ratemaking, multi-year rate agreements, and other departures from traditional regulatory mechanisms; and large scale industrial development; and
- Potential impacts on transmission system reliability from distributed electric generation, especially generation using renewable or innovative energy resources; energy conservation and efficiency; load control and peak saving measures; corporate reorganization of electric utilities; performance ratemaking, multi-year rate agreements, and other departures from traditional regulatory mechanisms; and large scale industrial development; changes in protocols for electricity dispatched through the bulk system operator; accommodation of proposed new electric generation facilities or repowering or life extension of existing facilities; and the market-driven nature of decisions to build, size, and locate such facilities.

In accordance with the provisions of Article 42 of the Executive Law, the Secretary of State will review the above described programs and actions for consistency with the coastal area policies. In particular, the Secretary will review the preparation of the State Energy Plan for assurance that there is adequate consideration of the national interest in the siting of the energy facilities which are necessary to meet requirements which are other than local in nature. The Secretary will take particular note of Policy 27 (decisions on the siting and construction of major energy facilities in the coastal area) and Policy 29 (the development of offshore resources) in making these decisions. For a further description of the process of siting energy facilities, see Part II, Section 7.

Recreation Facilities

Various documents, legislation, and federal agencies were consulted to determine the national interest in recreation facilities including: Nationwide Outdoor Recreation Plan; Gateway National Park Plan; Fire

Island National Seashore Park Plan; Land and Water Conservation Fund Act; Historic Preservation Act - P.L. 89-665; Heritage Conservation and Recreation Service; and National Park Service.

National recreation objectives drawn from the above sources are: (1) to consider recreation as an equal among other uses competing for space along coastlines; (2) to provide high quality recreational opportunities to all people while protecting the coastal environment; (3) to increase public recreation possibilities in high density areas; (4) to protect existing recreation areas from the adverse effects of contiguous uses; (5) to improve coordination and management of recreation areas; and, (6) to accelerate the no-cost transfer of surplus federal property for recreational uses.

New York's coast possesses many fine and varied public recreation areas, including the Fire Island National Seashore and a portion of the Gateway National Park System. The State's Coastal Management Program recognizes the multiple values of these facilities in terms of their contribution to the economy, their role in achieving more desirable land use patterns, and their immeasurable benefit to the health of residents and visitors. In support of these values and the national interest, New York's Program supports increasing the number of recreation facilities in its coastal area while protecting them from excessive use and incompatible adjacent development. For a complete discussion of recreation policies, see Part II, Section 6 of this report.

Conflicts between various national and State interests arise inevitably when activities, such as residential, transportation or energy development, compete with recreational facilities for use of limited waterfront space. Frequently, the other uses prevail because they are considered more profitable and more critical.

A number of State laws, plans and processes ensure that, among other critical concerns, the national interest in recreation will be adequately considered in New York State. First, the State Comprehensive Recreation Plan, administered by the Office of Parks, Recreation and Historic Preservation (OPRHP) contains a priority rating system for allocating funds for recreation purposes. One factor in that system gives positive weight to an activity which will contribute to the achievement of State, regional and national goals for recreation. OPRHP also administers the Urban Cultural Park Program which is intended to improve the physical, economic and recreational environments of the State's historic communities.

Under the State Environmental Quality Review Act, recreational concerns must be considered as part of the environmental assessment process; so too under Articles VII and 10 of the Public Service Law which requires environmental impact analysis for proposed energy facilities. Finally, under the Parks, Recreation and Historic Preservation, Environmental Conservation, Transportation, and Highway Laws, the State may acquire land for recreational purposes. Appendices E and F contain additional information on these laws and programs.

Transportation Facilities

In determining the national interest in transportation, the following documents and federal agencies were consulted: Department of Transportation Act (49 US 1651, et. seq.); Railway Safety Act of 1970 (45 US: 421); Coast Guard, Primary Duties (14 USC 2); Department of Transportation; Maritime Administration; Interstate Commerce Commission; and, U.S. Army Corps of Engineers.

From these sources, it was determined that the national interest in transportation is: (1) to develop a balanced national transportation system including well-integrated surface, air, water, and subsurface modes; and, (2) to provide fast, safe, efficient and convenient transportation via one or more modes for the movement of people, goods and services to, from, and through coastal regions.

The Coastal Management Program considers major ports, navigation channels, interstate highways, railroads, airports and their ancillary facilities to be in the national interest. For these facilities, the Program supports the State's Department of Transportation policies. These policies, as presented in the Department's *Transportation Master Plan*, are clearly supportive of national transportation concerns.

In the development of its Coastal Management Program, the State has indicated where conflicts exist or could arise between the Program's policies and the national interest in transportation. In the Hudson River Valley and at many locations along the Great Lakes, public access to the shorefront is inhibited by rail lines and interstate highways. Expansion or improvement of existing port facilities could interfere with existing or the provision of new recreational waterfront facilities. Finally, the dredging and deepening of navigation channels may adversely affect significant fish habitat and the quality of coastal waters.

In the face of these conflicts, New York State will continue to give adequate and balanced consideration to all national and State concerns through review of A-95 notifications and environmental impact statements prepared under the State's Environmental Quality Review Act. The Department of State will suggest reasonable mitigation measures and/or alternative sites as appropriate.

USES OF REGIONAL BENEFIT

As indicated previously, a State's coastal management program must ensure that local regulations applicable to land and water uses within the Coastal Area do not unreasonably restrict or exclude those uses which are of regional benefit. This requirement addresses the situation where a local government may oppose or place severe limitations on the siting of a needed regional serving facility or in another situation, where a municipality may fail to adequately protect natural resources which are deemed to be of area-wide importance.

Identification Criteria

New York's Coastal Management Program must identify uses of regional benefit and then demonstrate how each will not be unduly restricted or excluded. Two federal guidelines are to be followed in identifying such uses. First, the use or facility must have an effect on more than one unit of local government. Second, the use or facility must have a direct and significant impact on coastal waters.

This Program has used two additional guidelines in the identification of these regional uses. Since the overall objective of the State's Program is to implement its policies, such regional uses or facilities should then assist the State in the achievement of these policies. In particular, the need for a waterfront location should be taken into consideration, for it is the land along the shoreline where local, State and national concern is the greatest. Area-serving uses and facilities which are either publicly owned or regulated by the State is the other guideline that was used in this identification process.

Types of Regional Uses

Based upon the above federal and State guidelines, several types of land and water uses are identified, as well as the means for assuring that such uses will not be unreasonably restricted or excluded by local regulations.

1. Recreational uses of regional benefit shall include:
 - State parks and other recreational uses
 - County parks and other recreational uses

All of the above uses satisfy the identification criteria. First, they provide recreational opportunities to people who reside both within and outside the municipality where such uses are located. Second, these uses have direct effects on coastal waters, for the recreational activities conducted on waters and the adjacent lands may impair the quality of such waters. Third, all of the uses are cited in coastal policies as possible means for increasing water-oriented recreational opportunities. Finally, these uses are in public ownership and serve many communities.

The above recreational uses are not unreasonably restricted by local laws and ordinances. The acquisition and subsequent development of land within the Coastal Area for State and county recreational purposes are not subject to local regulations. Case law, rather than statutory provision, is the basis for this determination. Several judicial decisions have declared that State and county governmental functions are not subject to local land use regulation.⁶⁷ Therefore, the siting of such recreational uses within the Coastal Area of the State cannot be unreasonably restricted or prohibited by a local government.

2. Transportation uses of regional benefit shall include:
 - State and county highways, including necessary bridges and tunnels
 - Intercity and commuter rail service facilities, including necessary bridges and tunnels
 - Major cargo handling ports
 - Navigation channels serving major ports

These transportation and related uses satisfy the two federally required identification criteria and partially fulfill the State's Coastal Management Program guidelines. With respect to the required criteria, the above uses and facilities are of benefit to the residents in the locality as well as the people and businesses in the general area where such uses are located. Because of their nature, these uses may have direct and significant impacts upon coastal waters. In terms of the State's criteria, the Program's policies address either singularly or collectively the above transportation uses, for they are essential to economic activity within the Coastal Area and the State as a whole. Ports do require waterfront sites and navigation channels are, of course, situated in coastal waters. The other two transportation uses do not require a location in or near coastal waters, except in situations where a water body must be traversed to provide for uninterrupted service. Finally, most of the State and county highways are provided and maintained by their respective governments. There are situations, however, where this is not true for parts of New York's coastal area. For example, public authorities have been established, such as the Triborough Bridge and Tunnel Authority in New York City⁶⁸ for the purposes of constructing, operating and maintaining necessary bridges, tunnels and roadways leading to such facilities. All of the State's major port facilities and most of its rail service facilities are also constructed, operated and maintained by public authorities established under New York's Public Authority Law. Some railroad lines in New York's Coastal Area are still under private ownership, such as the Delaware and Hudson. As for navigation channels serving major ports, these are situated on underwater lands owned, and thus controlled by, the State of New York.

State and county highways are not subject to local regulation for the reasons discussed previously. The major ports and most of the rail facilities are not subject to local siting restrictions because of the powers generally granted to public entities. The siting of such facilities is regulated by the State's Department of Transportation.⁶⁹ The U.S. Corps of Engineers, in cooperation with the State's Department of Environmental Conservation, is responsible for maintaining the navigation channels serving the State's major ports.

3. Energy uses shall include:
- Electric generation facilities
 - Electric and gas transmission facilities

These uses and facilities fulfill several of the previously described identification guidelines. First, major electric and gas facilities are beneficial, for they supply the energy necessary for the operation of industries, transportation vehicles and services, and home heating. Second, these uses can have substantial impacts upon coastal waters. Third, if these facilities are properly sited and operated, several Coastal management Program policies will be achieved and state-wide concerns over their effects on water quality, fish and wildlife, air quality and aesthetics will be minimized. Also, some of these facilities do require locations along the waterfront or access to coastal waters in order to properly function. Finally, some major electric generation and transmission facilities are provided by the Power Authority of the State of New York (PASNY).

Steam electric generation and electric and gas trans-mission facilities are subject to the single comprehensive siting and permit procedures established under Articles VII and 10 of the Public Service Law. These processes ensure that such facilities will not be unreasonably restricted by local regulations. Hydro-electric and nuclear-fueled generation facilities are subject to federal review and approval.

FEDERAL CONSISTENCY PROCEDURES

Federal agencies are responsible for many activities that can affect the policies and overall intent of New York State's Coastal Management Program (CMP). In recognition of their potential effect, Congress passed the Coastal Zone Management Act of 1972, as amended, which required that the activities of federal agencies occurring within or outside the State's coastal zone that may affect land and water uses and natural resources in that zone must be consistent with New York's federally approved coastal management program. These federal activities that must comply with this requirement are:

- Federal agency activities (i.e. performed by or on behalf of a federal agency);
- Activities requiring federal licenses, permits and other regulatory approvals;
- Federal financial assistance to State and local governments; and
- Outer Continental Shelf Exploration, development and production activities.

New York State must ensure that the above federal activities are consistent with its CMP. To that end, the Department of State (DOS) has been designated as the State's agency responsible for reviewing federal activities as to their consistency with the CMP.

The bases for the consistency reviews conducted by DOS are: the enforceable policies of Part II, Section 6 of the CMP document; the guidelines found in the explanations of those policies; and the management programs for Special Management Areas, such as local waterfront revitalization programs, that have been approved and incorporated into the State's CMP. If an activity other than one performed by or on behalf of a federal agency⁷⁰ is found by DOS to be inconsistent with New York's CMP, the federal agency cannot proceed to authorize or financially assist that activity. A DOS consistency decision⁷¹ may be appealed to the U.S. Secretary of Commerce. If a DOS decision is appealed,⁷² the federal agency may only approve the activity after the Secretary determines that the activity is consistent with the objectives and purposes of the Coastal Zone Management Act or necessary in the interest of national security.

DOS will carry out its federal consistency review responsibilities in full compliance with the requirements of the Coastal Zone Management Act and 15 CFR Part 930. The Department will also strive to expeditiously review all federal activities that affect uses and resources in the State's coastal zone. To help DOS meet that objective, the following procedures supplement those contained in 15 CFR Part 930 and will apply to the federal activities reviewed by the Department.

General Elements of the Procedures

The following describes general elements of the federal consistency process. Specific procedures for each type of federal activity are described following this section and at 15 CFR Part 930

1. Early Consultation. Federal agencies and applicants should consult with DOS early in the planning stages of a proposed activity. This consultation should be considered as a necessary first step for all major, unique or potentially controversial activities. The purpose of this early consultation is to provide DOS the opportunity to advise federal agencies and applicants of: (a) general and, where possible, specific coastal management concerns raised by the proposed activities; (b) the coastal policies and other components of the State's CMP that are relevant to the proposed activities; (c) how to assess the consistency of the activities with the applicable policies; and, (d) the types of information and data that are essential for review purposes. This step will allow federal agencies and applicants the time to adequately address DOS CMP concerns and/or obtain necessary information, before the proposed activities are reviewed for consistency with the CMP. All federal agencies and applicants should consult with DOS to: determine if their activities would be subject to consistency review requirements; obtain information on the review process; and receive general guidance on how to proceed with their planned activities.

2. Information Needs. Whenever possible, the Department of State will base its consistency determination on documents normally required for compliance with federal regulations or approval. Generally, this documentation includes environmental assessments, environmental impact statements, permit and license applications, financial assistance applications and supporting information, as well as, the documentation required by 15 CFR Part 930.

DOS may request a federal agency or applicant to submit additional information for consistency review purposes. When this information is necessary, DOS will promptly notify the agency or applicant of this need, specify the type of information required, and state the reason(s) for the additional information. Request of this information does not alter the time period for DOS review.

3. Coordinated Review. When an activity is subject to both federal and state consistency review requirements, DOS and the other involved state agency will strive to concurrently conduct their respective reviews. This objective is possible only if the federal agency or applicant provides the required documentation submitted to another state agency to DOS as well.

DOS will coordinate its review of federal activities for consistency with New York's CMP with other state agencies and local governments with approved Local Waterfront Revitalization Programs.

4. Public Notice. DOS is required by 15. CFR Part 930 to issue public notice for federal agency activities and federal permits, licenses and other regulatory approvals that are subject to consistency review. To comply with that requirement, DOS will issue such notice in the State Register and may, at its discretion, also publish notice in newspapers having general circulation in the geographic areas of the proposed activities. All public notices issued by DOS will also be placed on the Department's website. DOS may, at

its discretion, issue public notice for proposed federal financial assistance activities. The public review comment period will normally be 30 days, but no less than 15 days.

5. Interagency Agreements. DOS may, consistent with the requirements of 15 CFR Part 930, enter into formal and informal agreements with federal agencies to further define the types of activities that would require consistency review, the timing of that review, joint public notification of proposed activities and other procedures that would expedite the review process and reduce regulatory burdens upon federal agencies and applicants.

Procedures for Federal Agency Activities

All federal agency activities affecting any coastal use or resource are to be undertaken in a manner that is consistent to the maximum extent practicable with the enforceable policies of the New York State Coastal Management Program. The enforceable policies of the New York Coastal Management Program include the policies and purposes of approved Local Waterfront Revitalization Program's. The specific procedures to assure this consistency are spelled out in 15 CFR Part 930.30 through 930.46.

The consistency determination must contain the following:

- a statement indicating whether the proposed activity will be undertaken in a manner consistent to the maximum extent practicable with enforceable policies of the New York State Coastal Management Program;
- a description of the evaluation of the effects of the activity on the relevant enforceable policies of the state's coastal management program;
- a detailed description of the proposed activity (including, as appropriate, maps, site plans, photographs and the timing of the activity), its associated facilities and their coastal effects; and
- comprehensive data and information sufficient to support the federal agency's consistency statement.

The amount of detail in the evaluation of enforceable policies, activity description and supporting documentation shall be commensurate with the expected coastal effects of the activity. This information must be available to the DOS in order for the review time period specified in the regulations to commence.

In order to help the DOS understand the proposed federal agency activity and its effects and thus facilitate and expedite the DOS review, DOS recommends that the following information be included, as appropriate, with the federal agency's consistency determination.

- the purpose and need for the activity
- alternatives to the activity considered by the federal agency
- identification of other approvals and funding needs from federal and state agencies (including copies of documentation submitted to those other agencies), e.g., water quality certifications, correspondence with the State Historic Preservation Officer, and US Army Corps of Engineers permit applications).
- required NEPA documentation (Environmental Assessment or Environmental Impact Statement, Finding of No Significant Impact, draft Record of Decision)

A federal agency should consult with DOS at an early stage in the planning of a proposed activity. This consultation should occur at the time the agency begins to identify alternatives for the proposed activity. DOS involvement at this juncture in the federal agency's planning process will ensure that all applicable coastal policies are factored into the identification and analysis of alternatives, and thereby increase the likelihood that the selected or preferred alternative will be found consistent with New York's CMP.

DOS will issue public notice on all federal agency activities that are subject to consistency review. This notice will be given in the *State Register* and may also be published in a newspaper having general circulation in the area(s) where a proposed activity will occur. The public review period will normally be for 30 but not less than 15 days. DOS will either concur, concur with conditions or object after public review and within the 60 day or extended time period allowable under 15 CFR Part 930, Subpart C.

If a federal agency determines that a proposed activity will not affect any coastal use or resource in the State's coastal zone, the agency may have to submit a negative determination to DOS. If a negative determination is required pursuant to 15 CFR Section 930.35, this determination must describe the activity, its location and the basis for this finding, which is to include an evaluation of the activity and the enforceable policies of the CMP. DOS will object to a negative determination, within the 60 day or extended time period allowable under 15 CFR Part 930, Subpart C, if the coastal effects of the proposed activity are reasonably foreseeable.

DOS will also monitor federal agency activities that are not listed in Part I of Table 3. DOS will notify a federal agency and request the submission of a consistency determination, if the agency's proposed activity will have reasonably foreseeable effects on the State's coastal zone.

Federal agencies, which are proposing activities which meet the Criteria for General Concurrence listed on page 11-9-27, may request concurrence from DOS that certain activities, other than development projects as defined in 930.31b, should not be subject to further DOS review because the activities will have minimal effects.

Procedures for Activities Requiring Federal Permits, Licenses and Other Regulatory Approvals

Activities in or outside of New York's coastal zone, which require federal permits, licenses and other regulatory authorizations and affect land and water uses and natural resources in the coastal zone, are subject to review by DOS for their consistency with the State's CMP. This requirement also applies to renewals and major amendments to such regulatory approvals.

A federal agency may not issue a permit, license or other authorization for an activity occurring in or outside and affecting the coastal zone unless: (a) DOS concurs or concurs with conditions with the applicant's consistency certification; (b) DOS concurrence is conclusively presumed; or (c) the U.S. Secretary of Commerce overrides DOS objection to the applicant's consistency certification.

An applicant seeking a federal permit, license or other authorization is responsible for submitting all of the documentation needed by DOS for its review of the proposed activity. This documentation is to be submitted at the time that an application for a permit, license, etc. is filed with the federal agency. DOS will commence its consistency review of a proposed activity upon receipt of all necessary data and information, which consists of the following items:

1. Copy of the federal permit, license, etc. application.

2. Copy of the completed Federal Consistency Assessment Form, which includes a signed consistency certification and written analysis of the proposed activity's consistency with the policies of the State's CMP.
3. Copy of all supporting documentation submitted with the federal application, including a detailed description of the proposed activity, its associated facilities and coastal effects, map(s) showing the geographic location of the proposed activity, site map(s) and diagram(s) drawn to scale showing all components of the activity and their location on the site, recent color photographs of the site, written statement on the purpose and need for the activity, identification of the owners of the abutting upland properties and underwater lands, and written analysis of alternatives to the proposed activity considered by the applicant.
4. Copy of the final Environmental Impact Statement, if required by the federal agency or by a state agency having jurisdiction over the proposed activity.
5. Copies of permit, license, etc. applications and related correspondence submitted to involved state agencies (e.g. DEC, OGS, SHPO, NYPA, PSC).
6. For energy facilities subject to Articles VII or 10 of the New York State Public Service Law all documentation submitted to the Siting Board for its consideration through to the conclusion of its public hearing process. Energy facilities undergo an extensive review by the State's Siting Board. DOS will participate in the review process when appropriate and advise the Siting Board of coastal policy concerns applicable to the proposed energy facility. DOS will coordinate its federal consistency review of major energy facilities with the Siting Board and other agencies involved in the Article VII or Article 10 processes.

The specific federal regulatory activities subject to consistency review by DOS, including those that may occur outside of the State's coastal zone and have reasonably foreseeable coastal effects, are listed in Part II of Table 3. DOS will review these activities for their consistency with New York's CMP in accordance with the procedural requirements of 15 CFR Part 930, Subpart D (or Subpart I for federal regulatory activities having interstate coastal effects). DOS will also monitor activities requiring federal regulatory approval that are not listed in Part II of Table 3 to determine if the activities may affect land and water uses and natural resources in the State's coastal zone. If DOS determines that an unlisted activity will affect coastal uses or resources, then DOS will advise the applicant, federal agency and OCM that a consistency review of the activity will be required. As part of this notification, DOS will request OCM's approval to review the unlisted activity.

DOS will issue public notice on those activities requiring federal regulatory approvals that are subject to consistency review. This notice will be given in the *State Register*. Notice may also be published in a newspaper having general circulation in the area(s) where a proposed activity will occur. The public review period will normally be 30 but no less than 15 days. If DOS decides to hold a public hearing on a proposed activity, notice will be given and indicate the purpose, date, time and place of the hearing. When acceptable to the federal agency and DOS, a joint public notice procedure may be established to meet both agencies' public review obligations.

Following public review and within the six month time period allowable under 15 CFR Part 930, Subpart D, DOS will either concur, concur with conditions, or object to an applicant's consistency certification. If the conditions in a DOS conditional concurrence are not acceptable to the applicant or the involved federal

agency, then the Department's decision must be treated as an objection to the applicant's consistency certification.

The Corps of Engineers may authorize activities by nationwide and general (regional and statewide) permits or by Letters of Permission. Whenever the U.S. Army Corps of Engineers proposes to issue or revise a nationwide or general permit, the DOS will review the proposed nationwide or general permit. For nationwide or general permits to which DOS objects to the consistency determination, or concurs with conditions, activities which would otherwise have been eligible for one of these permits will be reviewed as follows. When the Corps of Engineers notifies DOS of an activity which would have been authorized by a nationwide or general permit but for DOS's objection or concurrence with conditions to that permit, DOS will advise the applicant and the Corps within 30 days whether a consistency review is necessary. If a consistency review is necessary, the activity will be reviewed by DOS for consistency with the New York's Coastal Management Program. Activities that may be authorized by Letter of Permission will be subject to consistency review by DOS regardless of their location in the State's coastal zone. If a proposed activity may be authorized by a Letter of Permission and is determined by DOS that it does not significantly affect coastal uses or resources, DOS concurrence with the applicant's consistency certification will not be necessary. DOS will advise the applicant and the federal agency of its determination within 30 days of the receipt of notification from the Corps of Engineers that the activity may be authorized by a nationwide or general permit or Letter of Permission. Under this variance, the applicant is still responsible for submitting all of the above identified necessary data and information to DOS at the time it is filed with the federal agency.

In addition to the above variances to procedures in 15 CFR Part 930 Subpart D, DOS is providing a general concurrence to minor activities whose characteristics are such that they would not affect the achievement of the coastal policies or special management area plans either individually or when cumulative effects are considered. This general concurrence will apply to activities which meet the following criteria.

Criteria for General Concurrence

Activities will not require further DOS review and separate concurrences with consistency certifications if all of the following relevant criteria are met:

- The activity involves a use that is the same as, or similar to, adjacent or nearby uses;
- The activity is compatible with community character in design, size, and materials;
- If the activity would be in an area covered by an approved LWRP, the community advises that it is consistent with the community's land and water use controls for the area;
- The activity is identified in an approved LWRP as one that should be undertaken to advance the policies and purposes of the approved LWRP and the community so advises;
- The activity involves reconstruction, replacement, maintenance or repair of lawful structures, in-kind and in-place, and where applicable a community advises that it complies with an approved LWRP and DOS determines it complies with any applicable Special Management Area Plan;
- Other than for the exercise of riparian or littoral rights (see below), the activity is entirely on property owned or otherwise authorized by the owner for use by the proponent of the activity;
- The activity involves the exercise of riparian or littoral rights that

- is typical of lawful riparian or littoral access traditionally exercised in the area;
- complies with any applicable local standards; and
- avoids any unnecessary interference with navigation and other public uses of the water;
- The activity would not significantly impair the rights and interests of the public regarding the use of public lands or waters;
- The activity does not disrupt existing lawful water dependent uses;
- Other than for the exercise of riparian or littoral rights or the reconstruction, replacement, maintenance or repair of lawful structures (see above), the activity would not be undertaken in a vegetated wetland or natural protective feature;
- The activity would not generate or discharge non-point source pollution to coastal waters, or would provide a means of adequately treating non-point sources of pollution using accepted best management practices.

In order to monitor adherence to the criteria required for this general concurrence, applicants must submit all required necessary data and information listed above to DOS. If DOS determines that the activity meets the criteria for general concurrence, the applicant and federal agency will be notified within 30 days of receipt of the requisite data and information that the activity does not require a consistency review by DOS. If DOS determines that the activity does not meet the criteria, then the activity will be reviewed for consistency with New York's Coastal Management Program. The time period for this review would begin when the proposal was initially submitted assuming all the necessary information and data was also submitted at that time.

Procedures for Federal Financial Assistance to State and Local Governments

Applications for federal financial assistance (e.g. grants, loans, subsidies, guarantees, insurance, etc.) submitted by New York State agencies, local governments and related public entities (e.g. special purpose districts, authorities, etc.) to federal agencies for activities that occur within or outside the State's coastal zone and affect land and water uses and natural resources in the zone will be reviewed by DOS for consistency with the CMP. These activities include, but are not limited to, the planning, design and construction of new structures and facilities, alteration or demolition of existing structures and facilities, and the development of land and water use and resource management plans. The specific federal financial assistance activities subject to consistency review by DOS are listed in Part III of Table 3.

In accordance with the provisions of 15 CFR Part 930, Subpart F (or Subpart I in the case of a financial assistance activity having interstate coastal effects), an applicant for a listed federal financial activity should submit to DOS, at the time of filing an application with a federal agency, the following documentation to commence consistency review of the proposed activity:

1. Copy of the federal financial assistance application.
2. Detailed written description of the proposed activity.
3. Written evaluation on the relationship of the proposed activity and its reasonably foreseeable coastal effects to the applicable CMP policies.

4. Copy of all supporting documentation submitted with the federal application, including map(s) showing the geographic location of the proposed activity, and site map(s) and diagram(s) drawn to scale showing all components of the proposed activity and their location on the site.
5. Copy of the final EIS, if required by the federal agency or by the state or local agency having jurisdiction over the proposed activity.
6. Copies of state permit applications, if required; and related correspondence submitted to the involved state agencies.

New York State does not have a state clearinghouse established pursuant to Executive Order 12372. Therefore, DOS will monitor federal financial assistance activities not listed in Table 3 that occur within and all activities occurring outside of the State's coastal zone through notices published in the Federal Register, individual public notices issued by the federal agencies, and NEPA documents. If an unlisted activity or one occurring outside of the State's coastal zone is determined by DOS to have reasonably foreseeable effects upon the coastal zone, DOS will, within 15 days of the receipt of notification, inform the applicant, the involved federal agency and OCM that the proposed activity will be reviewed for consistency with the State's CMP.

DOS will, after the receipt of all of the above listed information, review minor federal financial assistance activities in 45 days or less. Major activities which involve NEPA or SEQRA documentation will be reviewed within 90 days of the receipt of all required documentation. This review period may be extended up to 45 days to provide additional time to evaluate a complex activity or to permit DOS the opportunity to seek public comment on a proposed activity. DOS is not required by 15 CFR Part 930, Subparts F or I to issue public notice for federal financial assistance activities that are reviewed by the Department for consistency with the CMP. DOS may, however, determine that public review of a federal financial assistance activity is warranted. If so determined, notice will be given in the *State Register* and may be published in a newspaper having general circulation in the area(s) where a proposed activity will occur. The public review period will normally be 30 but no less than 15 days.

During its review, DOS may consult with an applicant on conditions that would allow the Department to concur with the proposed activity. Upon completion of its consistency review, DOS will concur, concur with conditions, or object to the proposed activity. If the conditions in a DOS conditional concurrence are not acceptable to the applicant or the federal agency, then the Department's decision must be treated as an objection to the proposed activity.

Applicants for federal financial assistance which DOS determines meet the Criteria for General Concurrence listed above will be notified within 30 days that DOS does not object to the proposed activity.

Procedures for Outer Continental Shelf Exploration, Development and Production Activities

Activities, as described in Outer Continental Shelf(OCS) plans that require federal permits and licenses and may affect land and water uses and resources of New York's coastal zone, are subject to review by DOS for consistency with the State's CMP. This requirement also includes activities described in amended OCS plans

An involved federal agency may not issue the requested permit or license for an activity affecting the coastal zone unless: (a) DOS concurs (with or without conditions) with the submitted consistency certification; (b)

DOS concurrence is conclusively presumed; or (c) the U.S. Secretary of Commerce overrides DOS objection to a consistency certification.

A person (e.g. an individual, corporation, partnership, or government agency) seeking U.S. Department of Interior approval of a proposed OCS plan is responsible for submitting all of the documentation needed by DOS for its review of the federal permit and license activities described in the plan. This documentation is to be provided to DOS by the U.S. Department of Interior. DOS will commence its consistency review of the proposed federal permit and license activities upon receipt of all necessary data and information, which consists of the following items:

1. Copy of the proposed OCS plan, which identifies and describes the activities requiring federal permits and licenses and the reasonably foreseeable effects that those activities may have on land and water uses and resources of the State's coastal zone. The description of the proposed activities must include an evaluation of the activities' coastal effects and demonstrate how those effects would be consistent with the enforceable policies of the CMP, map(s) showing the geographic location of the proposed activities, site map(s) and diagram(s) drawn to scale showing all components of the proposed activities and their location on the site, and map(s) showing the location of commercial shipping lanes, existing oil and gas exploration, development and production activities and potential land bases for the proposed oil and gas activity.
2. Copy of Draft NEPA documentation including a draft Environmental Assessment or Draft Environmental Impact Statement (DEIS) if required by a federal agency.
3. Copy of the person's consistency certification.

DOS will commence its consistency review of the federal permit and license activities described in the OCS plan upon receipt of the above listed necessary data and information. During the course of its review, DOS may request the submission of additional information on the proposed permit and license activities. DOS will also coordinate its review with the relevant state agencies.

DOS will issue public notice on the federal permit and license activities described in the OCS plan that are subject to consistency review. This notice will be posted in the New York State Register. Notice may also be published in a newspaper having general circulation in the coastal region(s) which may be affected by the proposed activities. The public review period will be a minimum of 30 days. If DOS decides to hold a public hearing on the proposed activities, notice will be given and indicate the purpose, date, time and place of the hearing.

DOS will review federal permit and license activities described in the OCS plan as expeditiously as possible and strive to issue its concurrence, conditional concurrence or objection to a person's consistency certification within three months of commencing its review. If DOS cannot complete its consistency review in the three month period, the Department will notify the person, U.S. Department of Interior and OCM of the reason(s) for the delay. This notification will be given prior to the end of the three month period. DOS must conclude its review of the proposed activities within six months from the receipt of all necessary data and information or its concurrence may be presumed.

Table 3: Federal Activities, Affecting Land and Water Uses and Natural Resources in the Coastal Zone of New York State¹⁰⁹

This list has been prepared in accordance with the consistency provisions of the federal Coastal Zone Management Act and implementing regulations in 15 CFR Part 930. It is not exhaustive of all activities subject to the consistency provisions of the federal Coastal Zone Management Act, implementing regulations in 15 CFR Part 930, and the New York Coastal Management Program. It includes activities regarding: **1)** the submission of consistency determinations by federal agencies; **2)** the submission of consistency certifications by entities other than federal agencies; and **3)** the submission of necessary data and information to the New York State Department of State, in accordance with 15 CFR Part 930, Subparts C, D, E, F and I, and the New York Coastal Management Program.

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE COASTAL ZONE OF NEW YORK STATE	
I. Activities Undertaken Directly By or On Behalf of Federal Agencies	
The following activities, undertaken directly by or on behalf of the identified federal agencies, are subject to the consistency provisions of the Coastal Zone management Act, its implementing regulations in 15 CFR Part 930, Subpart C, and the New York Coastal Management Program.	
Department of Commerce	
National Marine Fisheries Service	Fisheries Management Plans
Department of Defense	
Army Corps of Engineers	Proposed authorizations for dredging, channel improvement, breakwaters, other navigational works, erosion control structures, beach replenishment, dams or flood control works, ice management practices and activities, and other projects with the potential to impact coastal lands and waters.
	Land acquisition for spoil disposal or other purposes.
	Selection of open water disposal sites.
Air Force, Army and Navy	Location, design, and acquisition of new or expanded defense installations (active or reserve status, including associated housing, transportation or other facilities).
	Plans, procedures and facilities for handling or storage use zones.
	Establishment of impact, compatibility or restricted use zones.
Department of Energy	Prohibition orders.
General Services Administration	Acquisition, location and design of proposed federal government property or buildings, whether leased or owned by the federal government.
Department of Interior	
Fish and Wildlife Service	Management of National Wildlife refuges and proposed acquisitions.
National Park Service	National Park and Seashore management and proposed acquisitions.

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE COASTAL ZONE OF NEW YORK STATE (cont'd)	
Bureau of Ocean Energy Management	OCS lease sale activities including tract selection, lease sale stipulations, etc.
Department of Homeland Security	
Coast Guard	Location and design, construction or enlargement of Coast Guard stations, bases, and lighthouses.
	Location, placement or removal of navigation devices which are not part of the routine operations under-the Aids to Navigation Program (ATON).
	Expansion, abandonment, designation or anchorages, lightering areas or shipping lanes and ice management practices and activities.
Department of Transportation	
Federal Aviation Administration	Location and design, construction, maintenance, and demolition of federal aids to air navigation.
St. Lawrence Seaway Development Corporation	Acquisition, location, design, improvement and construction of new and existing facilities for the operation of the Seaway, including traffic safety, traffic control and length of navigation season.
Federal Highway Administration	Highway construction
II. Federal Licenses and Permits and Other Forms of Approval or Authorization	
<p>The following activities, requiring permits, licenses, or other forms of authorization or approval from federal agencies, are subject to the consistency provisions of the Coastal Zone Management Act, its implementing regulations in 15 CFR Part 930, Subpart D, and the New York Coastal Management Program.</p>	
Department of Defense	
Army Corps of Engineers	Construction of dams, dikes or ditches across navigable waters, or obstruction or alteration of navigable waters required under Sections 9 and 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 401, 403).
	Establishment of harbor lines pursuant to Section 11 of the Rivers and Harbors Act of 1899 (33 U.S.C. 404, 405).
	Occupation of seawall, bulkhead, jetty, dike, levee, wharf, pier, or other work built by the U.S. pursuant to Section 14 of the Rivers and Harbors Act of 1899 (33 U.S.C. 408).
	Approval of plans for improvements made at private expense under USACE supervision pursuant to the Rivers and Harbors Act of 1902 (33 U.S.C. 565).
	Disposal of dredged spoils into the waters of the U.S., pursuant to the Clean Water Act, Section 404 (33 U.S.C. 1344).

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE COASTAL ZONE OF NEW YORK STATE (cont'd)	
	All actions for which permits are required pursuant to Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972(33 U.S.C. 1413).
	Construction of artificial islands and fixed structures in Long Island Sound pursuant to Section 4 (f) of the River and Harbors Act of 1912 (33 U.S.C.).
Department of Energy	
Federal Energy Regulatory Commission	Licenses for non-federal hydroelectric projects and primary transmission lines under Sections 3 (11), 4 (e) and 15 of the Federal Power Act (16 U.S.C. 796 (11), 797 (11) and 808).
	Orders for interconnection of electric transmission facilities under Section 202 (b) of the Federal Power Act (15 U.S.C. 824 a (b)).
	Certificates for the construction and operation of interstate natural gas pipeline facilities, including both pipelines and terminal facilities under Section 7 (c) of the Natural Gas Act (15 U.S.C. 717 f (c)).
	Permission and approval for the abandonment of natural gas pipeline facilities under Section 7(b) of the Natural Gas Act (15 U.S.C. 717 f (b)).
Economic Regulatory Commission	Regulation of gas pipelines, and licensing of import or export of natural gas pursuant to the Natural Gas Act (15 U.S.C. 717) and the Energy Reorganization Act of 1974.
	Exemptions from prohibition orders.
Environmental Protection Agency	NPDES permits and other permits for federal installations, discharges in contiguous zones and ocean waters, sludge runoff and aquaculture permits pursuant to Sections 401, 402, 403, 405, and 318 of the Federal Water Pollution Control Act of 1972 (33 U.S.C. 1341, 1342, 1343, and 1328).
	Permits pursuant to the Resources Recovery and Conservation Act of 1976
	Permits pursuant to the underground injection Control program under Section 1424 of the Safe Water Drinking Water Act (42 U.S.C. 300 h-c).
	Permits pursuant to the Clean Air Act of 1976 (42 U.S.C. 1857).
Department of Interior	
Fish and Wildlife Service	Endangered species permits pursuant to the Endangered Species Act (16 U.S.C. 153 (a)).

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE COASTAL ZONE OF NEW YORK STATE (cont'd)

Bureau of Ocean Energy Management	Permits to drill, rights of use and easements for construction and maintenance of pipelines, gathering and flow lines and associated structures pursuant to 43 U.S.C. 1334, exploration and development plans, and any other permits or authorizations granted for activities described in detail in OCS exploration, development, and production plans.
	Permits required for pipelines crossing federal lands, including OCS lands, and associated activities pursuant to the OCS Lands Act (43 U.S.C. 1334) and 43 U.S.C. 931 (c) and 20 U.S.C. 185.
Surface Transportation Board	Authority to abandon railway lines (to the extent that the abandonment involves removal of trackage and disposition of right-of-way); authority to construct railroads; authority to construct slurry pipelines.
Nuclear Regulatory Commission	Licensing and certification of the siting, construction, and operation of nuclear power plants, pursuant to Atomic Energy Act of 1954, Title II of the Energy Reorganization Act of 1974 and the National Environmental Policy Act of 1969.
Department of Transportation	Construction or modification of bridges, causeways or pipelines over navigable waters pursuant to 49 U.S.C. 1455.
	Permits for Deepwater Ports pursuant to the Deepwater Ports Act of 1974 (33 U.S.C. 1501).
Federal Aviation Administration	Permits and licenses for construction, operation or alteration of airports.

III. Federal Financial Assistance to State and Local Governments

Department of Agriculture	10.068	Rural Clean Water Program
	10.409	Irrigation, Drainage, and Other Soil and Water Conservation Loans
	10.410	Low to Moderate Income Housing Loans
	10.411	Rural Housing Site Loans
	10.413	Recreation Facility Loans
	10.414	Resource Conservation and Development Loans
	10.415	Rural Rental Housing Loans
	10.416	Soil and Water Loans
	10.418	Water and Waste Disposal Systems for Rural Communities
	10.419	Watershed Protection and Flood Prevention Loans
	10.422	Business and Industrial Loans
	10.423	Community Facilities Loans
	10.424	Industrial Development Grants

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE COASTAL ZONE OF NEW YORK STATE (cont'd)		
	10.426	Area Development Assistance Planning Grants
	10.429	Above Moderate Income Housing Loans
	10.430	Energy Impacted Area Development Assistance Program
	10.901	Resource Conservation and Development
	10.902	Soil and Water Conservation
	10.904	Watershed Protection and Flood Prevention
	10.906	River Basin Surveys and Investigations
Department of Commerce	11.300	Economic Development - Grants and Loans for Public Works and Development Facilities
	11.301	Economic Development - Business Development Assistance
	11.302	Economic Development - Support for Planning Organizations
	11.304	Economic Development - State and Local Economic Development Planning
	11.305	Economic Development - State and Local Economic Development Planning
	11.307	Special Economic Development and Adjustment Assistance Program - Long Term Economic Deterioration
	11.308	Grants to States for Supplemental and Basic Funding of Titles I, II, III, IV, and V Activities
	11.405	Anadromous and Great Lakes Fisheries Conservation
	11.407	Commercial Fisheries Research and Development
	11.417	Sea Grant Support
	11.427	Fisheries Development and Utilization Research and Demonstration Grants and Cooperative Agreements Program
	11.501	Development and Promotion of Ports and Intermodal Transportation
	11.509	Development and Promotion of Domestic Water-borne Transport Systems
Department of Housing and Urban Development	14. 112	Mortgage Insurance - Construction or Substantial Rehabilitation of Condominium Projects
	14. 115	Mortgage Insurance - Development of Sales Type Cooperative Projects
	14. 117	Mortgage Insurance - Homes

Table 4: Interstate Activities

The following activities in coastal areas of another state are listed and are routinely subject to review for consistency with applicable enforceable policies of the New York CMP in accordance with 15 CFR Part 930, Subpart I and other applicable Parts of 15 CFR Part 930.

INTERSTATE ACTIVITIES	
1. In the State of Connecticut	
Department of Defense	
Army Corps of Engineers	Construction of structures (e.g. bulkheads, revetments, groins, jetties, piers, docks, islands, etc.) or conduct of activities such as the mooring of vessels in navigable waters, or obstruction or alteration of navigable waters pursuant to Sections 9 and 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 401, et. seq.), in the Byram River within 50’ of the federal navigation channel in the Byram River or, where there is no federal navigation channel in the Byram River, within the Byram River within 50’ of the border of New York and Connecticut upstream to the US Route 1 bridge.
	Discharge of dredged and fill materials and other activities in the waters of the United States pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344) in Long Island Sound and Fishers Island Sound waterward of the 20’ bathymetric contour closest to the Connecticut shoreline.
	Activities subject to Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 (33 U.S.C. 1401 et seq.) In Long Island Sound and Fishers Island Sound waterward of the 20’ bathymetric contour closest to the Connecticut shoreline.

Table 5: Renewable Energy Geographic Location Description

The following authorizations for research, siting, construction, operations and maintenance, and decommissioning of offshore renewable energy generation infrastructure, and transmission infrastructure, in the Renewable Energy Geographic Location Description are listed activities. These approved activities are subject to review for consistency with applicable enforceable policies of the New York State Coastal Management Program in accordance with 15 CFR Part 930, Subpart D and E and other applicable Parts of 15 CFR Part 930.

FEDERAL ACTIVITIES AFFECTING LAND AND WATER USES AND NATURAL RESOURCES IN THE RENEWABLE ENERGY GEOGRAPHIC LOCATION DESCRIPTION	
Department of Defense	
Army Corps of Engineers	Construction of dams, dikes or ditches across navigable waters, or obstruction or alteration of navigable waters required under Sections 9 and 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 401, 403).
	Occupation of seawall, bulkhead, jetty, dike, levee, wharf, pier, or other work built by the U.S. pursuant to Section 14 of the Rivers and Harbors Act of 1899 (33 U.S.C. 408).
Department of Energy	
Federal Energy Regulatory Commission	Permits and licenses required for marine hydrokinetic projects pursuant to the Federal Power Act. (16 U.S.C. §§ 792 to 823; implementing regulations at 18 C.F.R. Chapter 1, Subchapter B, Parts 4 and 5).
	Permits and licenses for interstate electric transmission facilities under Section 216 of the Federal Power Act (16 U.S.C. § 824p).
Department of Interior	
Bureau of Ocean Energy Management	Permits required for pipelines crossing federal lands, including OCS lands, and associated activities pursuant to the OCS Lands Act (43 U.S.C. 1334) and 43 U.S.C. 931 (c) and 30 U.S.C. 185.
	Issuance or approval of leases, permits, easements, rights-of-way, research activities, and other authorizations pursuant to the OCS Lands Act (43 U.S.C. §§ 1331 et seq.; 43 U.S.C. § 1337(p); implementing regulations at 30 C.F.R. Part 585), including in response to unsolicited requests, for the planning, construction, operation, maintenance and/or support activities related to OCS renewable energy development.

PUBLIC PARTICIPATION

As indicated previously, governmental entities, interested parties and the general public must have the opportunity to participate in the development of a state's coastal management program. From the outset of developing New York's Program, the Department of State actively sought to inform and involve private citizens, local, regional and statewide interest groups, local governments, and regional and State agencies. The Department prepared a Coastal Management Handbook outlining the issues and explaining the purposes of the federal program. A display and slide show were also prepared and taken to meetings to increase public awareness of coastal resources and issues.

In the first years of program development, local and regional agencies were under contract with the Department to inventory coastal resources and to make recommendations on preliminary boundaries and areas warranting special management attention. During this period, Department staff met on a one-to-one basis with local officials and conducted small workshop sessions with officials, interest groups and coastal residents. These meetings proved to be a most productive public involvement technique.

Citizens Advisory Committee

The core of the State's public involvement effort is the Coastal Management Citizens' Advisory Committee. The committee is made up of representatives from the five coastal regions of the State. It met regularly during the development of the program to review technical reports, make recommendations on the State's program and legislation, and assist in public participation activities.

Public Meetings

During June and July of 1978, the Department held a series of 16 public meetings in the coastal regions of the State from Lake Erie to Long Island. The purpose of these meetings was to receive public reaction on the general approach for developing the coastal program. In advance of these meetings, the Department widely distributed a newsletter identifying certain coastal issues and suggesting possible alternatives for program administration. The newsletter asked whether local governments should be required to participate in a coastal management program or whether State agencies alone should operate this type of program. It also asked what State agency should be responsible for the program. Maps showing the proposed boundaries of New York's Coastal Area were displayed at these meetings.

The meetings drew comments from coastal residents, community groups, universities, regional organizations, local governments and others. These participants raised excellent questions about boundaries, areas, and problems of particular concern, funding potentials, adequacy of existing authorities, private property rights, regional coordination, rationale of the various local/State administrative options, approval and monitoring of local programs and more. Following these meetings a draft Coastal Management Program document was prepared which incorporated recommendations submitted earlier by regional and local agencies and also included ideas expressed at the public meeting.

Public Hearings

In April, 1979, the Department of State held 9 public hearings in the coastal regions of the State. The purpose of these hearings was to receive comments from all parties interested in implementing legislation. The Department broadly disseminated these documents prior to the hearings. A summary describing coastal policies and showing the proposed Coastal Area was also distributed.

Comments

The hearings again drew comments from a wide variety of individuals and organizations. Participants expressed major concerns about the following:

- The proliferation of State bureaucratic structures which would be ineffective and which would infringe upon the authority of local governments.
- The need for expanded representation on the Coastal Management Board to include members from particular fields of expertise and from various geographic regions.
- The need to use existing review procedures to implement the coastal program.
- The definition of coastal erosion hazard areas and the procedures for identifying these areas.

Responses

In response to the above concerns, the following actions were taken:

Program legislation was revised to provide that an existing agency - the Department of State - serve as the State's Coastal Management Agency. Certain additional responsibilities were given to the Secretary of State relative to determining consistency of federal actions with the State's Program, and receipt and administration of federal grants.

The concept of a Board was dropped, but an advisory committee was structured to provide specific representation from ten particular areas of expertise and eight specific geographic areas. In addition to these 16 members, the advisory committee would be comprised of six ex-officio members representing the State agencies with major responsibilities for carrying out aspects of the Coastal Management Program. The advisory committee would provide advice to the Secretary on the conduct of the Program.

The legislation was revised to provide for the use of the State Environmental Quality Review Act as the mechanism by which State agencies would determine the consistency of their proposed actions with the Coastal Management Program. Where two or more State agencies had jurisdiction over a particular project and these agencies had irreconcilable differences as to the consistency of an action, the legislation was revised so that a project applicant or either agency could request the Secretary of State to resolve differences. The Secretary could consult with the advisory committee in any dispute resolution.

The definition of the coastal erosion hazard areas was expanded to permit identification of dunes, beaches and other natural areas providing protection against erosion to other land. In addition, this legislation was revised to provide for identification of erosion hazard areas after the Department of Environmental Conservation (DEC) had adopted program regulations. A new requirement also called for the DEC to promulgate standards and criteria for the design and construction of erosion protective structures so that they have a reasonable probability of controlling erosion for at least 30 years.

Legislative Hearings

Late in 1979, the New York State Senate and Assembly jointly sponsored hearings to solicit public views on the proposed coastal management and coastal erosion hazard areas bills. Participants were asked to address a number of concerns including: the adequacy of the bills to address environmental, economic and

social impacts on New York's coastline; the appropriate role of government agencies in implementing a State coastal program; the economic benefits of State and local participation in the federal program as well as the costs to the private sector; and modifications which should be made in the two bills.

Testimony at these hearings concerning the future of the Coastal Management Program was overwhelmingly in favor of the legislative passage of these two bills (38 statements in favor; 13 opposed). Even some of the testimony opposed to the proposed legislation was in support of the idea of coastal management and merely called for a restructuring of the management process.

Comments

The basic thrust of the supportive arguments was that:

- (1) a statewide management program was necessary to provide for the coordination of land use, and natural resource protection policies in the coastal regions;
- (2) erosion hazards areas legislation was needed since erosion has a major impact on people living along the shores of Lake Ontario and Long Island;
- (3) a statewide program, working in concert with local authorities, was necessary to ensure New York State's consistency with federal guidelines and regulations concerning Coastal Zone Management;
- (4) a State-administered Coastal Management Program approved by the federal government is a prerequisite for the allocation of Coastal Energy Impact Program (CEIP) funds to New York and that the State should not lose this opportunity for federal monies.

The arguments opposed to a State Coastal Management Program basically maintained that:

- (1) existing legislation, if properly implemented, was good enough to protect vital coastal resources and that additional legislation would duplicate existing regulation and cause confusion over authority leading to bureaucratic entanglement;
- (2) the federal government's CEIP funds were being offered to New York "like a carrot on a stick" and that in the rush to receive a federal grant, the legislation was not being properly considered;
- (3) bills did not offer enough protection to the coastal environment and were too permissive and vague in allowing commercial and industrial development along ecologically sensitive waterfronts; and,
- (4) the proposed legislation would infringe upon economic or recreational activities of farmers and sportsmen, respectively, through the increased governmental control of land uses.

Responses

In 1980, the legislation was again modified to reflect the comments received at the legislative hearings:

- Water dependent activities were redefined to include other than economic activities, and specific recognition was given to the attraction of coastal areas for residential purposes.
- Membership of the advisory committee was expanded to include expert representatives from the areas of residential construction and tourism.
- Legislative provisions on Geographic Areas of Particular Concern were simplified and substantially revised to include certain aesthetic areas, agricultural lands, fish and wildlife habitats and water dependent use areas.

- Coastal policies were simplified and the way in which they apply was clarified.
- Improvements were made to better integrate the consistency review process with State Environmental Quality Review Act procedures.
- A specific procedure was added for voluntary withdrawal of local governments from participation in the State program.

In June, 1980, the New York State Assembly passed both the program and erosion bills, but the Senate did not. In 1981, a new bill entitled the Waterfront Revitalization and Coastal Resources Act was introduced in the Legislature. This bill included a balanced approach to coastal resource protection and development; use and coordination of existing State environmental management and economic development programs; streamlining of procedures; and voluntary local programs. The bill was, however, shortened and simplified with an emphasis on local revitalization efforts. This was in response to criticism about potential negative economic impacts of a coastal program. In July, the Senate and Assembly passed the waterfront revitalization and erosion bills and the Governor signed them into law.

Year of the Coast 1980

In 1980, Governor Carey joined in proclaiming the Year of the Coast. The Department of State then organized or participated in organizing a number of events to highlight the importance of the State's coast. The Department brought together local government representatives from coastal areas to a workshop where they shared their experiences on a variety of local projects. In the summer, the Department worked with the Mid-Hudson League of Women Voters to organize a "See-shore Sail"; and in September, the Department held a Year of the Coast boat ride in New York City to view potential revitalization sites. Finally, the Department co-sponsored a conference with the New York-New Jersey Port Authority on revitalization of the port. A number of brochures updates and maps were prepared for distribution at these events.

SECTION 10 – DESCRIPTION OF WORK PROGRAM

INTRODUCTION

Throughout this document, a number of activities and items have been identified and discussed that are essential to the effective administration and implementation of New York State’s Coastal Management Program. The discussion on these activities have provided the Department of State with the basis for developing a work program which would be carried out under New York’s initial 306 grant. The purpose of this section is to briefly describe the types of activities that will be undertaken by the Department, other State agencies and local governments during the grant period.

PROGRAM OBJECTIVE

The principal aim of New York State’s first grant under Section 306 of the Coastal Zone Management Act, as amended, is to put into effect the essential components of the State’s Coastal Management Program. These programmatic elements will initiate new and advance ongoing State activities that are in support of the national policies expressed in Section 303 of the Act, specifically:

- (1) the protection of natural resources;
- (2) reduction of life and property losses in flood and erosion prone areas;
- (3) proper siting of major facilities and other forms of development, including priority consideration of coastal dependent uses;
- (4) provision for better public access to the coast;
- (5) assistance for revitalizing waterfronts and ports and for preserving coastal features;
- (6) simplification of governmental procedures;
- (7) coordination and consultation with federal agencies;
- (8) public and local government participation in coastal management decision-making; and
- (9) assistance for the planning, conservation and management of living marine resources.

All of the above policies, as well as the policies contained in the State’s Coastal Management Program, are addressed by work tasks which are grouped into seven major categories:

1. Program administration
2. Consistency review
3. Coastal resources protection
4. Coastal resources development
5. Major activities affecting coastal resources
6. Public information
7. Local waterfront revitalization programs

PROGRAM ADMINISTRATION

The primary objective of this category is to establish and undertake administrative activities that will support or lead to the effective implementation of the State's Coastal Management Program. As the designated "lead agency", the Department of State will perform various programmatic, fiscal management and legal activities which are essential to the overall administration of the State's Program and 306 grant. In addition, the Department must fulfill administrative and review responsibilities required by the State's Waterfront Revitalization of Coastal Areas and Inland Waterways law. Some of the tasks that will be performed under this category including the review and approval of local waterfront revitalization programs, evaluation of federal and state legislative proposals for their potential impacts upon the State's coastal program, and the revision of the Coastal Area maps to incorporate information on the location of significant habitats and scenic resources, important farm lands and areas with approved local waterfront revitalization programs.

CONSISTENCY REVIEW ACTIVITIES

The sole objective of this category is to ensure that the actions of federal and State agencies are consistent with the policies of New York State's Coastal Management Program. The tasks under this category provide for two separate review processes which take into account the different roles to be performed by the Department of State. These processes are crucial to the implementation of New York's coastal program. Therefore, the Department will consult with federal and State agencies in order to familiarize the agencies' staffs with content and intent of New York's coastal program policies and procedures. This effort should minimize any conflicts or differences that may arise during these review processes.

As the State's 306 agency, the Department of State will coordinate the consistency review procedure applicable to activities undertaken or approved by federal agencies. This will involve providing public notice and holding public hearings, when necessary, and reviewing consistency determinations and certifications. The Department will also review the proposed actions of state agencies and provide recommendations to the agencies on the consistency of their actions.

COASTAL RESOURCES PROTECTION

The protection of significant natural coastal resources is a goal of New York State's Coastal Management Program and the federal Coastal Zone Management Act of 1972, as amended. The objective of this work program category is not a broad sweeping one, but instead is directed at implementation activities which will provide further protection to significant fish and wildlife habitats, important agricultural lands and scenic resources of statewide significance as well as beaches, dunes, barrier islands and bluffs in erosion prone areas.

Specifically, the rating and identification of significant fish and wildlife habitats was started in 1980. The identification of important agricultural lands and scenic areas of statewide significance will begin being mapped in October 1982. During the early spring of 1983, there will be opportunity for federal, State and local agencies as well as the general public to comment on the maps and accompanying narrative, if any. After consideration of comments received the information will be transferred to the Coastal Area Map and formally incorporated into the program by the end of the grant period.

The mapping of erosion hazard areas has been underway since 1980. In January 1983, maps of areas with high rates of erosion (four feet or more per year) will be available for review by the affected local

governments. After holding public hearings and considering all the comments on the identified areas, the Commissioner of the Department of Environmental Conservation will formally designate the areas with high rates of erosion by May, 1983. Following such designations, affected local governments have six months to develop and adopt regulations for the erosion hazard areas (See Article 34, ECL for further details).

The identification of the remaining erosion hazard areas will begin by spring 1983 and will be completed no later than January, 1984 as required by Article 34. Funding under Section 306 of the OCZM Act will be provided to DEC to assist its efforts to complete this mapping before January, 1984.

COASTAL RESOURCES DEVELOPMENT

The wise use and proper development of New York's coastal resources is of vital importance to the State and its waterfront communities. The overall objective of this category is to improve upon the current economic and social utilization of the State's waterfront while ensuring the protection of significant resources. In response to this objective, the work program includes several different activities which focus upon the use of coastal resources. Three of the tasks to be performed center around the development of coordinated policies and strategies for commercial fishing and port operations. Access to existing recreational facilities and publicly owned lands will be identified as well as the opportunities to increase access to such facilities and lands. Efforts will be started to determine ways for simplifying existing federal, State and local procedures which affect waterfront development activities. Also alternative methods for financing such development activities will be investigated, and the information distributed to waterfront communities.

MAJOR ACTIVITIES AFFECTING COASTAL RESOURCES

There are a number of ongoing and potential activities within and outside New York State which could affect the management of coastal resources. It is important to the success of New York's Coastal Program that the Department of State participate in these activities to reflect programmatic concerns as well as receive valuable advice. Thus, the objective of this category is to coordinate the State's Coastal Management Program with other state, interstate, national and international efforts that may impact the use and protection of New York's coastal resources.

Tasks in the work program which respond to this objective include: the creation and operation of a statewide advisory committee on waterfront revitalization and coastal management; participation on regional, interstate and international committees or organizations which have general and specific coastal interests; and participation on the State's Hudson River Estuarine Sanctuary Steering Committee.

PUBLIC INFORMATION

Public awareness is essential to a successful and sustained coastal management program. The objective of this category, therefore, is to ensure that the general public, State and local officials understand the importance of coastal resources, the thrust of the State's Program and the means for properly managing the resources. The publication and distribution of documents is one means of meeting this objective; however, other techniques will be employed. For instance, the Department of State will sponsor a waterfront revitalization conference and design competition to generate interest and innovative approaches to waterfront related problems. Also, a popular brochure will be produced to assist AMTRAK riders in identifying important scenic, historic and other points of interest along the Hudson River.

LOCAL WATERFRONT REVITALIZATION PROGRAMS

The State's Coastal Management Program and the Waterfront Revitalization of Coastal Areas and Inland Waterways law recognize that the development of detailed local programs based on the State's coastal policies will augment the State's means for implementing those policies. The objective of this category is to initiate a concerted effort to have local governments develop and implement waterfront revitalization programs. This effort will consist of three components: (1) aid for the preparation of appropriate approval documentation; (2) assistance for the development of local programs; and (3) support of activities which will implement approved local programs. All such local programs must address all relevant coastal policies. Each community's program will focus on major concerns which reflect community, State and federal priorities. For example, LWRPs would include implementation provisions for increased: resource protection; water dependent uses; access; waterfront revitalization; dredging; permit simplification; and other issues of concern, commensurate with the particular circumstances of that community.

PART III. ALTERNATIVES TO THE PROPOSED ACTION

FEDERAL ALTERNATIVES TO THE PROPOSED ACTION

All alternatives to the proposed action, approving the New York Coastal Management Program, involve a decision to delay or deny approval. Delay or denial of approval could be based on failure of the New York Coastal Management Program to meet any one of the requirements of the Coastal Zone Management Act. In approving a Coastal Management Program, affirmative findings must be made by the Assistant Administrator for Coastal Zone Management on more than twenty requirements.

Development of the New York Coastal Management Program has involved eight years of work. Alternative approaches including different forms of legislation have been introduced. Of particular concern throughout program development was the method of obtaining consistency of State agency actions with the coastal program. Another major concern has been the adequate protection of beaches and dunes. The first issue is addressed in Section 919 of the Waterfront Revitalization of Coastal Areas and Inland Waterways law. The second issue was addressed in passage of the Shoreowners Protection Act (Coastal Erosion Hazard Areas, Environmental Conservation Law Article 34).

The Assistant Administrator for Coastal Zone Management has made a preliminary determination that New York State has met the requirements for program approval under Section 306 of the Coastal Zone Management Act.

However, in order to elicit public and agency comment and assure that the Assistant Administrator's initial determination is correct, this section identifies issue areas where there may be possible need for revisions and considers the alternatives of delaying or denying approval based upon each issue area.

LOSS OF FEDERAL FUNDS TO ADMINISTER THE PROGRAM

Under Section 306, New York would receive approximately \$3 million to administer its coastal management program; if such funds are made available pursuant to Congressional action. The loss of any available federal Section 306 funds would result in the inability of the State to provide adequate staffing and administrative support to coordinate and evaluate coastal actions, implement a state coastal program, address priority issues, and assure that government agencies coordinate and operate consistently with coastal policies. State technical assistance to local governments, essential for the development of local waterfront revitalization programs, would also be curtailed due to limited funds. To deny approval of this program would also make it difficult for the State to coordinate and expedite resolution of conflicts, and establish unified state policies for State actions in the coast. Denial of approval would also jeopardize the eligibility of the State to receive Coastal Energy Impact Program (CEIP) funds pursuant to Section 308 of the Coastal Zone Management Act.

LOSS OF CONSISTENCY OF FEDERAL ACTIONS WITH THE PROGRAM

Approval of New York's Coastal Management Program would mean federal actions in or affecting the Coastal Area would have to be consistent with the State Coastal Management Program under

Section 307 (c) of the Coastal Zone Management Act. Loss of federal consistency with the State's Coastal Management Program would have significant and adverse effects on the resources of the State's coastal area.

FEDERAL ALTERNATIVES

Alternative 1: The Assistant Administrator could delay or deny approval if the State cannot adequately manage activities having direct and significant impacts on coastal waters.

Section 305 (b) (2) of the federal Coastal Zone Management Act requires each state seeking approval of its program to manage land uses which have direct and significant impacts on coastal waters. The Assistant Administrator has made a preliminary determination that New York has such management authority not only in special areas such as wetlands and erosion hazard areas but also throughout the Coastal Area based on its Waterfront Revitalization of Coastal Areas and Inland Waterways law (WRCAIW) and its State Environmental Quality Review Act (SEQRA).

Section 919 of the WRCAIW requires State agencies to act consistently with the Coastal Area policies. As a result of the amendments to the SEQRA and the Department of State (DOS) regulations as contained in Appendix A, two procedures will be used to assure State agency actions will be undertaken consistent with these policies.

First, all actions subject to a State agency's authority and that may have a significant effect on the environment will be reviewed through the SEQRA process by those State agencies party to the action. The amendments to the SEQRA will ensure that direct State actions including public investments such as highways, major sewer and water lines and wastewater treatment facilities must be consistent with the coastal policies. The SEQRA review process will also tie to the coastal policies the issuance of State permits for all significant public and private projects requiring a State Pollutant Discharge Elimination System permit from the Department of Environmental Conservation (DEC). The SEQRA not only requires full disclosure of the environmental impacts of significant activities, but also has been interpreted as containing the authority for agencies to condition or deny permits to ensure environmental compatibility. *Miracle Mile Associates, v. DEC*. 430 F. Supp 2nd 440 (July 10, 1980).

Second, pursuant to the DOS regulations, all direct and funding actions, other than permitting actions, under-taken by a State agency that do not have a significant effect on the environment will be reviewed by the State agency for consistency with the coastal policies. At the time that the agency makes a decision on an action, a certification of consistency must be forwarded to the Department of State.

Alternative 2: The Assistant Administrator could delay or deny approval if the policies of the program are not specific enough to meet the requirements of the Federal Coastal Zone Management Act.

CZMA regulations 923.11 (b) (2) and 923.(b) (4) require that coastal policies must provide a clear sense of direction and predictability for decision makers who must take actions pursuant to or consistent with the management program. Specificity is particularly important when such policies will be administered in part by local governments, as will be provided in local waterfront

revitalization programs. It is also important to assure that State administered policies are not subject to an excessively broad range of interpretations.

The Assistant Administrator has made the preliminary decision that the new policies and standards contained in the Waterfront Revitalization of Coastal Areas and Inland Waterways law and regulations together with those existing policies, standards and regulations incorporated into the program from other State legislation, provide sufficient specificity for program approval. This decision is based in part on the draft guidelines contained in Appendix B, which give local governments much further assistance in preparing more specific policies for their voluntary local waterfront revitalization programs.

Alternative 3: The Assistant Administrator could delay or deny approval if the boundary is not adequate to meet the requirements of Section 304 (1) - definition of the coastal zone and 923.31 (a) of the CZM regulations - inland boundaries.

Section 304 (1) of the Coastal Zone Management Act states that the coastal zone shall extend inland from the shoreland only to the extent necessary to control shoreland uses which have a direct and significant impact on coastal waters. The State has established a boundary that is approximately 1,000 feet inland from the shorelines. However, in urbanized locations it is about 500 feet inland and in a few areas where a major roadway or railroad line runs parallel to the shoreline it is less than 500 feet. Detailed maps of the exact boundary at a scale of 1:48,000 have been filed with clerks of coastal counties, cities, towns and villages and with state agencies.

The issue can be raised of the adequacy of regulating in urban areas less than 500 feet from the shoreline. Federal CZMA regulations 923.31 (c) (general comments), however, clearly allow for a narrower boundary in urban areas by stating that “in many urban areas or where the shoreline has been modified extensively, natural system relationships between land and water may be extremely difficult, if not impossible, to define in terms of direct and significant impact”. Because of the nature of the New York coastline in the urban areas - its extensive bulkheading, high density, existence of infrastructure, and generally built-up character - the Assistant Administrator has preliminarily determined that the State will be regulating in an area adequate to cover all uses that have a direct and significant impact on coastal waters. The criteria which were employed for delineation of the final boundary are outlined in further detail in Part II, Section 3 of this document. Reviewers of this DEIS were especially encouraged to comment on any land use which could occur inland of this boundary which may have a direct and significant impact on coastal waters.

STATE ALTERNATIVES TO THE PROPOSED ACTION

INTRODUCTION

During development of New York’s Coastal Management Program, a number of substantive and organizational alternatives were considered at length. The Legislature, in passing the Waterfront Revitalization of Coastal Areas and Inland Waterways law, made a choice about the particular combination of these alternatives which were to operate in the State. Thus, the number of alter-natives left to be examined in this environmental impact statement has been greatly reduced. Before discussion of the current alternatives, a history of the major alternatives considered during program development is presented below.

A. HISTORY OF MAJOR ALTERNATIVES

The discussion of options focused on various possibilities for legal program authority. A coastal management program could have been based on State legal authorities at either the State level or delegated to the local level, or a combination of both. In New York, State agencies have strong management authorities for matters of statewide or regional concern, while local governments have strong powers to manage issues of local concern. On a number of matters, a close interrelationship exists between the exercise of authority at State and local levels. State and local authority alternatives were considered separately as follows.

1. State Authority Alternatives

a. Status Quo

The status quo alternative would continue all existing State programs with no new additions. A specific coastal management program would not be established. This alternative would rely on the State policy, as expressed in Article XIV, Section 4 of the Constitution, to conserve and protect the State's natural resources and scenic beauty and encourage the development and improvement of its agricultural lands. The Legislature, in implementing this policy, has enacted numerous programs that already provide for management of most resources of statewide or regional concern in the coastal area. Important programs administered by the Department of Environmental Conservation deal with air quality, water quality and supply, tidal and freshwater wetlands, flood plains, and streams as well as mining, dredging and energy development activities. Other State agencies, such as the Office of Parks, Recreation and Historic Preservation, the Department of Transportation, and the Office of General Services, also administer a wide range of programs to manage, use, and regulate resources in the coastal area.

While a wide variety of issues affecting New York's Coastal Area have already been given special attention, this alternative would create no mechanism to coordinate separate State and local activities that affect the coastal area. Thus, coastal resources would not be managed as effectively as possible. Further, this alternative would add no new authorities to deal with the specific problems of severe coastal erosion and siting of water dependent uses. As a result of these inadequacies, the status quo alternative would not fulfill the requirements of the federal Coastal Zone Management Act.

b. Coordinate existing State program authorities

Under this alternative, a State coastal management program would incorporate the many existing State management programs and add new authority to coordinate or "network" these programs. This would provide for integrated management of coastal resources and lead to achievement of identified State coastal management policies.

Coordination of the State authorities could be accomplished through inter-agency memoranda of understanding, through an Executive Order from the Governor, or through specific State authorizing legislation. Also, a single State agency would be designated to administer the program, although that specific agency need not itself have the power to enforce the coordination of programs.

This alternative would ensure the coordinated management of coastal resources in matters of statewide or regional concern, but would leave gaps in existing authorities (in particular,

management of erosion hazard areas) and would fail to qualify the State for federal approval of a coastal management program.

c. Coordinate existing State program authorities plus additional program authorities to fill gaps (essentially the alternative chosen)

This alternative would be the same as the coordination alternative but would add several specific new program authorities to fill identified gaps in existing programs. These additions would include authority to regulate development in erosion hazard areas and provide for designation of water dependent uses.

This alternative would qualify New York State for federal coastal management program approval.

d. Comprehensive coastal management program authority

This alternative would also keep all existing State program authorities, but would add new legislative authority to institute a comprehensive State coastal management program for directly controlling development throughout the coastal area. A variety of sub-options exist for this alternative in terms of the extent to which development would be controlled. These options range from a program that would directly control all development anywhere in the coastal area to one that would directly control only a few key types of development with a specified minimum size in specific designated locations. This alternative would establish priorities for permissible uses in specific locations within the coastal boundary, both in terms of areas appropriate for development and areas where development would be inappropriate.

This alternative would establish a new level of authority for the State's coastal resources. It would provide uniform statewide implementation of policies for coastal resources and would increase predictability regarding the use of coastal resources. The alternative would qualify the State for approval of its coastal management program, making federal financial assistance available to the State. However, it could create problems associated with possible preemption of existing authorities, both State and local. Also, the establishment of a new level of government administration could either expedite or delay the development process in coastal areas, depending on the effectiveness of the administration.

2. Local Authority Alternatives

a. Status Quo

This status quo alternative would simply continue unchanged the existing powers and responsibilities of local governments. Under authority of Article IX of the New York State Constitution (the "Bill of Rights for Local Governments"), the Statute for Local Governments, the Municipal Home Rule, and various other statutes, local governments in New York State are authorized to exercise a broad range of powers, including the enactment of strong land use control programs if they so choose, as long as these powers are not specifically preempted by State and federal law. Local land use control programs are exercised primarily through local zoning and subdivision controls, which can be used to manage land and water resources of a community. In addition, under the State Environmental Quality Review Act (SEQR), local governments are required to consider environmental factors in reaching decisions on proposed actions and to prepare impact statements on actions which are likely to have significant effects upon the environment.

The status quo alternative would be consistent with New York State's "home rule" tradition and would be responsive to many local attitudes about desirable levels of local involvement in land use regulations. However, because the use of local authority is optional, local land use control programs in coastal areas range from very strong to nonexistent. Furthermore, not all local land use programs in coastal areas fully consider the environmental and economic importance of coastal resources. Thus, significant gaps in the management of coastal resources by local governments would remain, as would the problems and cumulative impacts of independent local decisions.

Although the State's Coastal Management Program could provide the basic level of management required for federal program approval, the status quo local alternative would result in inconsistencies between State and local policies, where these exist, leading to conflicts in the protection and management of coastal resources and to possible losses of those resources not explicitly protected by State programs. Also, although the State would maintain its jurisdiction over the siting of facilities which serve a region, opposition of local governments could limit the ability of the State to promote actions such as economic development in desirable locations.

- **Voluntary local coastal management programs complying with State Coastal Management Program (essentially the alternative chosen)**

Under this alternative, specific provisions would be made in new State legislation for local governments to adopt local coastal management programs that would comply with the State's Coastal Management Program. This alternative would differ from the status quo alternative in that approvable local programs would be required to meet State's established criteria. Participating local governments would be eligible for financial and technical assistance in preparing local management programs and in managing coastal resources. Also, the actions of State and federal agencies would be consistent with such local coastal management programs.

Although this alternative would result in greater local participation in coastal management than under the status quo alternative and would thus provide additional management attention to coastal resources, the voluntary nature of local participation would result in similar problems of inconsistency and conflicts, particularly between those localities that do and do not participate in the program. The actual amount of local participation would depend to a significant extent on the specific approval criteria used by the State coastal management agency and the amount of federal financial assistance available for implementation of local coastal management programs. Whatever the level of local involvement, the regulatory process in coastal areas could become more complex. There would, thus, be a need for measures to coordinate and streamline review and permitting processes.

- **Mandatory local coastal management programs complying with State Coastal Management Program**

This alternative would establish, through new State legislation, a requirement that local governments in coastal areas adopt local coastal management programs consistent with the State Coastal Management Program. Counties would be authorized to prepare and implement coastal management programs if a locality failed to act; in the event the county failed to act, the State's coastal management agency would implement a program in the

locality. Local governments would be eligible to receive financial and technical assistance for preparing and implementing local coastal management programs.

This alternative would eliminate the problems of potential State-local conflicts in the protection and management of coastal resources that would be present in the status quo and voluntary local program alternatives. Depending on the specific State requirements for local coastal management programs, this alternative could help to assure statewide coverage and consistency with the Coastal Management Program, increase enforceability of coastal policies as a result of the universality of local management programs, and result in better management and protection of coastal resources by including decisions of sub-regional significance in the overall Coastal Management Program. It would, however, affect local autonomy by requiring that local governments use their present authority to develop and implement coastal management programs, in accord with State guidelines. This could be seen either as a loss of local “home rule” power or as a strengthening of these prerogatives through the partnership of local governments with other levels of government.

- **Preemption of local government coastal management authority**

Under this alternative, any local controls in the Coastal Area which are not consistent with a comprehensive State coastal management program would be superseded by legislation declaring the management of coastal resources to be a matter of State concern. In effect, such controls as zoning would be exercised by the State coastal management agency for areas within the management boundary.

This alternative would prevent problems of inconsistency between local actions and the State management program and would ensure a uniform management program throughout the coastal area. Coastal resources would be better managed and the development process in coastal areas would be more predictable. However, the alternative would significantly limit local “home rule” powers in coastal areas and would move many land-use and resource decisions from the local to State level.

3. Additional Alternatives

a. Boundaries

In order to have an effective coastal management program, the boundaries of the Coastal Area must be clearly defined. The federal Coastal Zone Management Act requires the boundaries to extend inland” only to the extent necessary to control shorelands, the uses of which have a direct and significant impact on the coastal waters.” Within this requirement, the boundaries could be drawn broadly or narrowly.

An expansive boundary, such as one that included all of the watersheds draining into the State’s coastal areas, could include virtually all uses affecting coastal waters, but would do so at the expense of having to control many uses which have little or no effect on coastal waters.

An expansive boundary would thus be an inefficient means of providing management of coastal resources and could require substantial administrative support. A limited boundary, such as one that extended only a short distance from the shoreline (e.g., 500 feet) would substantially limit the area subject to the Coastal Management Program, but might not provide for all uses that could

affect coastal waters. A compromise between these two alternatives, based on consideration of specific local and statewide interests in each segment of the coast, is a third alternative.

There are two other options regarding the application of a coastal management program within designated boundaries. One involves a multiple-tier boundary which divides the Coastal Area into two or more sub-areas that are subject to different levels of management. This would complicate the administration of a coastal management program which by its nature is complex. The other involves a single-tier boundary within which a coastal management program would apply equally.

b. Funding

The State could decide not to seek approval of a coastal management program under the federal Coastal Zone Management Act, but there are significant advantages to a federally approved program, including financial assistance. Section 306 of the Act authorizes such funding, but other sections of the law authorize financial assistance for specific aspects of coastal management, such as coastal energy impacts. There are a number of major categories to which such funding, if appropriated by the Congress, could be allocated, including the following:

- Administration of the Coastal Management Program. This would include such administrative functions as applying for, accepting and distributing assistance, as well as monitoring and evaluating performance and compliance with the program by other agencies. Administration funds would be used by the “306” Agency.
- Improving management of existing State programs incorporated in the Coastal Management Program. This could include providing additional regulatory staff for specific programs that are key to the coastal management effort, such as erosion hazard areas, in order to provide improved protection and management and speed the processing of permit applications.
- Preparing and adopting local coastal management programs. Funding could be provided directly to local governments to prepare and adopt local programs for managing coastal resources. In addition, funding could be used to support technical assistance to local governments by the “306” Agency or other State agencies.
- Implementing adopted local coastal management programs. Assistance could be provided to local agencies to administer local management programs and to provide additional support for local management efforts.

B. CURRENT ALTERNATIVES

1. Alternative Choices Concerning State Participation in Federal Coastal Management Program

a. Participate in the Federal Coastal Management Program - Proposed Action

Since states participate voluntarily in the federal Coastal Management Program, New York State could determine that it is necessary and desirable for the implementation of its State-mandated coastal program to participate and seek federal approval of the State program.

With an approved program, and subject to Congressional appropriations, New York would be eligible to receive federal Coastal Management Program (“306”) and Coastal Energy Impact

Program (CEIP) funds which could in turn be used to leverage additional assistance from other sources. The “306” and CEIP funds would help to support State administration of its coastal program and could be vital to effective implementation of waterfront revitalization and resource protection aspects of the State program. Moreover, financial assistance could be particularly important as an incentive to local governments in need of aid not otherwise available for project planning to revitalize deteriorated and under-utilized coastal areas.

In addition, by participating in the federal program, New York would benefit from the consistency requirements of the federal Coastal Zone Management Act. These requirements would create a continuing dialogue between the State and federal agencies engaged in activities in New York’s coastal area. Thus, federal agencies would be better informed about the State’s coastal concerns and would be able to make decisions more sensitively and more efficiently. Also, those potentially affected by federal actions would be better able to predict the outcome of the decision-making process.

Finally, New York’s participation in the “306” phase of the federal Coastal Management Program would be an appropriate conclusion to years of State and federal efforts under the “306” phase to develop a well-balanced State Coastal Management Program. An approved State program would also be important for the achievement of national coastal objectives.

The alternative to participate in the federal Coastal Management Program could, however, have certain disadvantages. During the “306” phase, State compliance with federal program regulations could increase administrative duties for State agencies, thus increasing costs and delaying implementation activities mandated by the Waterfront Revitalization of Coastal Areas and Inland Waterways. The State could rely on “306” funding to cover some costs incurred by participation in the federal program, but reductions in federal funding levels seriously jeopardize implementation of the State program.

In addition, by participating in the federal program, New York could find itself in conflict with the federal government over respective priorities for resources to be protected and activities to be encouraged. Further, national priorities could change making it difficult for the State to operate a consistent program. Ultimately, federal involvement in State decision-making might be viewed as excessive and encroaching upon State prerogatives.

b. Not to participate in the federal Coastal Management Program - No Action Alternative

Since State participation in the federal program is voluntary, New York could choose not to participate. Whether the State chooses to participate or not, it must, nonetheless, implement the recently enacted the Waterfront Revitalization of Coastal Areas and Inland Waterways law. The “no participation” alternative could be reasonable, if federal program regulations were to hinder the State from taking immediate and necessary steps to implement the Act and if “306” funds were suddenly reduced or terminated. Further, this alternative could allow the State to avoid conflicts with the federal government over respective priorities for managing New York’s coastal resources, and would prevent further intervention of the federal government in the management of its coast. (See also discussion of disadvantages under Proposed Action alternative.)

On the other hand, the “no participation” alternatives would have disadvantages. A decision not to participate could, regardless of current efforts at the national level to reduce domestic program

expenditures, result in the loss of funds which could be vital to the implementation of State and local aspects of New York's coastal program. Further, federal consistency provisions would not be applicable to New York, and the State could not expect federal agencies to abide by its coastal policies when undertaking actions within New York's coastal area.

Finally, New York and the federal government have both expended considerable efforts toward instituting a Coastal Management Program in the State. A decision not to participate in the federal program would not only reduce the State's effectiveness in implementing its program, but would also significantly limit the federal government's ability to achieve national coastal management objectives since New York has one of the most extensive, varied and valuable coastlines in the Nation.

2. Alternative Administrative Mechanisms for Implementing State Consistency Requirements

a. Implement the State consistency requirements of the Waterfront Revitalization of Coastal Areas and Inland Waterways law (Article 42) by amending State Environmental Quality Review Act and Department of State regulations to require that proposed actions be consistent with the coastal area policies of the law - Proposed Alternative

This alternative would satisfy the intent of the law in two ways. First, for all actions requiring preparation of an environmental impact statement under the State Environmental Quality Review Act (SEQR), it would incorporate the need to achieve consistency with the coastal policies contained in Article 42. Thus, the decisions on all actions which may have a significant impact on the environment must be consistent with the coastal policies. Second, for direct actions which do not have a significant effect on the environment, Department of State regulations require State agencies to certify that the actions are consistent with the coastal policies of Article 42.

This alternative would for the most part eliminate the need for the Department of State to consult at length with more than fifty State agencies, since they will simply use the existing SEQR process to determine the consistency of significant actions. Also, with this alternative, SEQR procedures would remain substantially unaltered except for the need that the findings be in accord with coastal policies.

The consistency review requirements under SEQR and Department of State regulations will allow the Department to monitor activities in the coastal area. With this information, the Department of State will be able to advance recommendations to the Governor and the Legislature for more effectively implementing the Waterfront Revitalization of Coastal Areas and Inland Waterways law.

b. Implement State consistency requirements of the Waterfront Revitalization of Coastal Areas and Inland Waterways law by formal agreements (memoranda of understanding) between the Department of State and other State agencies

This alternative would satisfy the intent of the law, but the Department of State would have to consult with more than fifty State agencies in developing these agreements. This effort would be time-consuming and costly. In addition, certain small but significant programs might be overlooked with so many programs being considered. Also, the different regulatory procedures of each agency would make this alternative very complex, and there would be no mechanism for efficient

monitoring of agency decisions. Thus, the Department of State could not assess the effectiveness of coastal policies in order to improve their implementation. Still, formal agreements with other State agencies would provide assurances that their decision-making procedures had at least incorporated coastal policies so that all agencies regarded coastal revitalization and protection goals similarly.

c. Implement State consistency requirements of the Waterfront Revitalization of Coastal Areas and Inland Waterways law by informal agreements between the Department of State and other State agencies

This alternative might satisfy the letter of the law; however, it would probably not satisfy its intent to coordinate State agencies actions and programs so as to ensure consistency with coastal policies. Again, the Department of State would have to consult with numerous agencies; the results would be the same as under the “formal agreement” alternative. In addition, informal agreements with other State agencies would provide no real assurances that their interpretations of coastal policies were acceptable or that various decision-making procedures had in fact incorporated coastal policies. As a consequence, implementation of coastal policies would be complex and uneven. As under the previous alternative, informal agreements would provide no mechanism for regular exchange of information on proposed agency actions or final decisions affecting the coastal area. Thus, again, the Department of State could not assess the effectiveness of coastal policies nor take well-founded steps to improve their implementation.

3. Alternatives Concerning the Department of Environmental Conservation and the Coastal Erosion Hazard Areas Law

a. Promulgate regulations which implement the provisions of Article 34 - Proposed Action

Shoreline recession, beach erosion and creation of potentially hazardous conditions by destroying protective landforms are problems which have long plagued New York’s coastal areas. Hundreds of millions of dollars have been expended attempting to halt coastal erosion by structural means such as construction of seawalls, revetments, groins, bulkheads, and artificial nourishment. Article 34 is based on the rationale that erosion is a naturally occurring phenomenon of tremendous physical proportions. Structural attempts at harnessing nature are always very expensive, occasionally ineffective and usually not cost effective. Erosion protection structures have sometimes created as many problems as they have solved.

Article 34 directs the Department of Environmental Conservation to identify coastal areas subject to serious erosion and establishes State policies regarding the regulation of certain activities and development in such erosion hazard areas. State policies also require that certain activities and development in areas containing protective landforms should be regulated so as to maintain their capability to withstand the forces of erosion and high water.

Section 34-0108 directs the Commissioner of Environmental Conservation to promulgate rules and regulations which will implement the provisions of Article 34. These regulations must contain the following:

- standards and criteria to regulate certain activities and development in erosion hazard areas;

- standards and criteria governing the location and construction of erosion protection structures;
- a procedure pursuant to which any owner of land in an identified erosion hazard area may appeal such designation; and
- a procedure by which the strict application of standards and criteria may be varied where practical difficulty or unnecessary hardship can be demonstrated.

6NYCRR Part 505 are the regulations which the Department of Environmental Conservation has developed to meet the statutory mandates of Article 34. These regulations are contained in Appendix A of this document.

b. Do not promulgate regulations to implement Article 34 - No Action Alternative

The no action alternative would ignore the legislative mandate of Article 34 and result in continuance of the status quo regarding the regulation of land use and development in coastal erosion hazard areas. Since many local governments in the coastal areas of New York State do not have adequate, if any, local laws or other management programs to address erosion problems, unwise development and inappropriate activities would continue. This would result in continued unnecessary environmental damage and economic and social costs to not only coastal residents, but to the general population as well. Unwise development in coastal hazard areas ultimately places a financial burden on all taxpayers through payment of disaster aid. Likewise, coastal environmental degradation is a cost borne by everyone whether it is higher costs for seafood, degradation of aesthetic quality, reduced opportunities for recreation or diminished potential for harvesting or viewing fish and wildlife resources.

The no action alternative is obviously not viable. First of all, the Department of Environmental Conservation would have to blatantly ignore a statutory mandate of the New York State Legislature. Secondly, the Coastal Erosion Hazard Areas law had the solid support of State agencies, including the Department of State and Environmental Conservation, and many organizations with an interest in proper coastal management, as well as many coastal local governments.

c. Do not promulgate regulations to implement Article 34 - Education/Information Program

This third alternative would be for the Department of Environmental Conservation to ignore the regulatory mandate of Article 34 and develop a public education/information program with no regulatory aspects. The Department of Environmental Conservation would identify and quantify areas of coastal erosion and provide this information to interested parties. The Department could also develop model local ordinances to be used by local governments interested in taking a more affirmative step in reducing erosion and high water damage problems. As a third step the Department could develop handbooks or other instructive material which provide information on coastal erosion processes and the importance of preserving coastal landforms which protect against flooding and erosion. Such information could provide advice on the limitations of coastal natural systems to development.

However, such a course of action would necessitate ignoring a clear legislative mandate. Furthermore, an education/ information program probably would not be effective because most coastal land owners are not interested in erosion issues until they are directly affected. Coastal

erosion management is most beneficial and cost effective, if it can be implemented before erosion or high water problems exist. Furthermore, by eliminating the regulatory (i.e. permit) aspects of an erosion management program, State and local governments lose the potential for such programs to be financially self-sufficient through collection of permit fees.

PART IV. AFFECTED ENVIRONMENT

GENERAL DESCRIPTION

For further description of the affected environment, refer to Part II, Section 2 - Coastal Regions, Resources and Problems of New York.

The Coastal Area of New York State is comprised of all coastal waters within the State's territorial jurisdiction and the shorelands adjacent to these waters. Article 42 of the State's Executive Law describes coastal waters as: lakes Erie and Ontario; St. Lawrence, Niagara, East and Harlem rivers; Hudson river south of the Federal dam at Troy; Kill von Kull and Arthur Kill; Long Island sound; Atlantic ocean; and, their connecting water bodies, bays, harbors, shallows and marshes. The latter include, but are not limited to, the following:

1. Block Island sound;
2. Great South, Shinnecock, Great Peconic, Little Peconic, Gardiners, Napeague, Moriches, Smithtown, Northport, Huntington, Manhasset, Little Neck, Flushing, Jamaica, Upper New York, Lower New York, Eastchester, Raritan, Irondequoit, Sodus, Little Sodus, Henderson, Black River and Chaumont bays;
3. Hempstead, Cold Spring, Port Jefferson, Oyster Bay and Huntington harbors; and,
4. Extensive segments of the Peconic, Connetquot, Nissequogue, Carmans, Bronx, Hutchinson, Croton, Buffalo, Genesee, Oswego, Black, Chaumont, Grass and Raquette rivers.

Entire lengths or substantial segments of numerous creeks, many small bays, harbors and ponds, and extensive saltwater and fresh water marshlands are included within the State's coastal waters.

The onshore portion of New York State's Coastal Area is limited, by Article 42 of the Executive Law, to adjacent shorelands containing uses which have a direct and significant impact upon coastal waters. These shorelands include, but are not limited to, islands, wetlands, beaches, dunes, barrier islands, bluffs, intertidal estuaries and erosion prone areas. In addition to the above, onshore physical and human-made conditions were taken into consideration. As a result of this process, the onshore portion of the State's Coastal Area varies from region to region. Generally, the following conditions prevail:

1. The inland boundary is approximately 1000 feet from the mainland's shoreline;
2. In developed or urbanized locations along the coast, the inland boundary is about 500 feet from the shore line or less in areas where a major roadway or railroad line runs parallel to the shoreline; and,
3. Where major State-owned facilities and lands and electric power generation facilities abut the shoreline, the boundary is extended inland to include such lands and facilities.

On Long Island, the State's Coastal Area includes all barrier and other islands located in the coastal waters of this region. On the mainland, the inland boundary is generally 1000 feet from the shoreline, however, at major tributaries and headlands it extends several thousand feet inland.

In New York City, the Coastal Area boundary extends inland 500 to 1000 feet, generally. On Staten Island and at major tributaries (e.g., Bronx River, Newtown Creek, and Flushing Creek) the boundary is several thousand feet in from the shoreline.

The Coastal Area boundary extends 1000 to 8000 feet inland along the Long Island Sound Coast of Westchester County.

In the Hudson River Valley, the Coastal Area boundary is generally 1000, but at some locations over 10,000, feet inland. The latter occurs at places which are exceptionally scenic (e.g., Hudson Highlands) or have significant agricultural and recreational lands.

Finally, the Coastal Area in the Great Lakes region of the State extends over 1000 feet inland from the shoreline. However, in the urbanized and built-up areas of the coast (e.g., Buffalo, Rochester, Oswego, Alexandria Bay, and Ogdensburg) and at several locations where major roadways and rail lines parallel the shoreline, the boundary may extend 500 feet or less inland.

TABLE 5 Local Governments with Jurisdiction Over Land and/or Waters Within New York State’s Coastal Area

LOCAL GOVERNMENTS WITH JURISDICTION OVER LAND AND/OR WATERS WITHIN NEW YORK STATE’S COASTAL AREA				
County	City	Town	Village

PART V. ENVIRONMENTAL CONSEQUENCES

A. ENVIRONMENTAL

New York State proposes to implement a Coastal Management Program that is consistent with the federal Coastal Zone Management Act of 1972, as amended. New York's Program will further the goals of the federal act, i.e., to protect, preserve, develop and restore our coast's land, water, and air resources so they may continue to fulfill human present and future needs. The State's Program is designed to achieve a balance between resource development and preservation activities in the coastal area by encouraging the most environmentally appropriate uses of coastal resources and by minimizing or avoiding many of the adverse environmental consequences of coastal development.

To implement the Coastal Management Program, the State will rely upon various existing State programs (See Appendices E and F for a description of these State programs) plus the recently enacted Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42) and the Coastal Erosion Hazard Areas law (Environmental Conservation Law Article 34). While Coastal Management Program implementation will not significantly alter the environmental effects of any single, existing State program, the integration and coordination of these programs as required by the waterfront law will create net environmental benefits for the State's coastal area.

The Waterfront Revitalization of Coastal Areas and Inland Waterways law (WRCAIW) provides for a balanced statewide approach for encouraging development in coastal areas while protecting natural resources. The WRCAIW establishes the boundaries of New York State's coastal area by formally adopting a map which the Department of State, with considerable local government input, has prepared. This map is on file in the Secretary of State's office as well as in the offices of affected local governments, counties, and State agencies. This legislation also calls upon local governments to prepare waterfront revitalization programs. The 240 local governments eligible to participate in this waterfront revitalization program are listed in Table 3 in Part IV of this document. Participation in this program is at the option of the municipalities. As of this writing, there are approximately 50 communities eager to develop local waterfront revitalization programs. Because of previous work and cooperation with the Department of State, as many as 15 communities are likely to have an approved program early in the first year. Should they elect to prepare such waterfront programs, the Department of State will provide technical and financial assistance under specific guidelines set forth in the WRCAIW. The local waterfront revitalization programs will be prepared in conjunction with the policies set forth in the legislation. These policies apply in the mapped coastal area and have been developed to "insure the proper balance between natural resources and the need to accommodate the needs of population growth and economic development." They deal with the need for coastal development, better utilization of New York State's waterfront areas, and protection of significant coastal resources. Furthermore, the WRCAIW gives the Secretary of State a broad advisory role in reviewing and evaluating State activities and programs in the coastal area. The Secretary must, within six months of the effective date of the legislation, identify each State agency that has programs and powers affecting coastal resources, and six months thereafter must report to the Governor and Legislature on the present level of consistency of State programs. Finally, the Secretary must identify State agency programs which will likely affect the achievement of any approved local waterfront revitalization program.

The Coastal Erosion Hazard Areas law requires the New York State Department of Environmental Conservation, in full cooperation with affected local governments, to complete a preliminary identification

of erosion hazard areas throughout New York State's coastline. Erosion hazard areas will be identified by determining annual land recession rates along the coast. Erosion hazard areas will also include natural protective features such as dunes, beaches, and shoals. The Act requires that consultations and public hearings must take place before final identification is made. Once final identification is made of the erosion hazard areas, regulatory provisions of the legislation will apply. Any activities or development proposed for such areas will only be approved if they meet certain minimum standards and criteria related to the: use of setbacks; prevention of an increase in erosion; minimization of adverse effects on natural protective features; and measures to ensure the effectiveness of control structures. The legislation also specifies that, when public funds are to be used for activities and development, the public benefits must clearly outweigh any long-range adverse effects. The legislation also offers each affected local government the opportunity to deal with erosion hazard areas identified within its boundaries through the community's own laws or ordinances. Should the affected local government not exercise its right to regulate such areas, the county, or finally, the State Department of Environmental Conservation would promulgate regulations for that community.

The New York State Coastal Management Program has been designed to improve the management of the State's coastal resources. To achieve this end, the Program includes a set of coastal policies applicable to State agency actions in the Coastal Area which (1) steer development away from environmentally sensitive areas such as fish and wildlife habitats, wetlands, and scenic areas; (2) channel waterfront development and revitalization activities towards areas which are either without ecological and physical development constraints or areas which had once been developed but need rehabilitation; (3) promote the proper use, development or preservation of coastal erosion hazard areas such as beaches, bluffs, dunes, and barrier islands; and (4) encourage wise utilization of coastal resources which are renewable (e.g., commercial fisheries) and non-renewable (e.g., underwater sand and gravel deposits). These coastal policies will provide a comprehensive framework to guide future resource management and land use decisions by State, and where appropriate, federal and local agencies.

The formal and legal integration of decision-making by federal, State and local government agencies will achieve better management and utilization of the State's coastal resources. Improved communication and coordination of all three levels of government will be achieved by implementing the consistency provisions of State and federal legislation and through the development, approval and implementation of local waterfront revitalization programs. Through these inter-governmental coordination procedures, resource use conflicts will either be resolved more quickly and efficiently or avoided altogether. By alleviating resource development pressures, the Program will help prevent over-exploitation of particular renewable coastal resources. Also, the possibility of identifying underutilized resources is increased with improved inter-governmental communication.

Another means by which the State Coastal Management Program will provide for environmentally appropriate uses of coastal resources and minimize many of the otherwise adverse environmental consequences of coastal development is by using the natural and cultural resource inventory, provided for in the Waterfront Revitalization of Coastal Areas and Inland Waterways law. This inventory will provide a consolidated source of information which will be valuable to public agencies and private developers in the identification of potential sites for a specific use or development activity.

Considerable effort has already been expended during Program development by State, regional and local agencies to gather and compile land use and natural resource data throughout the State's coastal regions. The Waterfront Revitalization of Coastal Areas and Inland Waterways law requires the Department of State

to maintain and update this data inventory. It will, therefore, continue to provide an expanded resource information base which will enable the State and participating local governments to make more environmentally sensitive decisions with regard to conservation, allocation and commitment of coastal resources.

The implementation of the Coastal Erosion Hazard Areas law is expected to result in significant long-term environmental, social and economic benefits to the people of New York. The full impact of the program will not be felt immediately upon implementation. In fact, it may take years before definite results can be identified. Nevertheless, the positive economic, social and environmental impacts should be substantial.

Damage from erosion and storm induced high water to structures placed or constructed in conformance with the erosion program's regulations will be significantly reduced. Problems caused by inappropriate or poorly designed erosion control structures constructed pursuant to the standards and criteria of 6 NYCRR Part 505 should be eliminated. The enforcement of minimum setbacks for new structures in coastal areas experiencing high rates of shoreline recession will ultimately result in less need for costly, and often environmentally undesirable, erosion protection structures. The conservation and preservation of natural protective features will help insure their existence for future generations.

Other benefits include a more natural appearing coastline. As a result of mandatory minimum setbacks for new structures, these structures will not encroach and detract from the scenic qualities of the shoreline. Another benefit is the preservation of coastal landforms such as dunes, bluffs, barrier islands and spits which are, to most people, more aesthetically pleasing than artificial structures such as groins, revetments, or seawalls. The encouragement of nonstructural approaches may also foster a greater understanding of the inherent natural functions and values of coastal features.

1. UNAVOIDABLE ADVERSE ENVIRONMENTAL EFFECTS

New York State's Coastal Management Program is not expected to have many unavoidable adverse environmental effects.

The Program will encourage new water dependent development to locate in areas which are already developed and/or which are environmentally suitable for such development. This new development may increase air and water pollution, but these unavoidable effects are regulated under existing programs so that State air and water quality standards are not violated. New development may also require dredging of channels, but these activities must be conducted according to existing State and federal regulations so as to reduce adverse impacts on water quality, fish and wildlife habitats, and other natural resources.

Another unavoidable effect may be short-term economic losses that might occur by favoring water dependent uses which at the time may not be the most profitable or desired use of waterfront lands. Although every effort will be made to find ways to offset this economic loss, there probably will be instances where this cannot be done.

2. IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES

State adoption and federal approval of the Coastal Management Program will not in and of itself lead to losses of coastal resources. The implementation of coastal management policies will affect the actions of State agencies and participating local governments in the coastal area, and may thereby result in irreversible and irretrievable commitments of resources. For example, policies to channel growth to already-developed locations along the coast and to give priority to water dependent uses will lead to increased development at

these sites and result in irreversible commitments of resources. Development activity necessarily results in the affected site being committed to the new use for an indefinite period of time, and can practically be considered irreversible and irretrievable. To the extent that the Program supports acquisition of environmental, cultural and recreational resources in coastal areas, the Program will result in commitment of these resources to public use, and the exclusion of these areas from future private use. This is especially true of areas added to the State Nature and Historical Preserve Trust, which are given constitutional protection and cannot be taken out of the preserve except by law enacted by two successive regular sessions of the Legislature.

B. INSTITUTIONAL

Although the State's Coastal Management Program will rely largely on the use of existing State programs, it will also create new institutional arrangements designed to focus attention on, and improve the management of, coastal resources. These new arrangements will not affect present constitutional relationships between State and local government, but should increase coordination and cooperation among State agencies and different levels of government as well as encourage local governments to exercise their powers and responsibilities more fully in coastal areas. The new arrangements should also help local governments resolve problems on a partnership basis with State and other local agencies which they previously had to face alone.

The Program establishes State coastal management policies that will guide State and federal agency actions, along with those actions taken by participating local governments. The Program will require that all such actions be consistent with the coastal policies. (The policies are described in detail in Part II of this document.)

To assist State agencies in carrying out their responsibilities to be consistent with policies, the Department of State has worked with the Department of Environmental Conservation to develop a consistency review process that is coordinated with the existing State Environmental Quality Review (SEQR) procedures. The interagency effort has resulted in proposed regulations that will facilitate the determination of an action's consistency with the coastal policies and will not complicate SEQR procedures.

The consistency review regulations take two forms:

1. Selected amendments to the existing SEQR regulations;
2. Regulations to be promulgated by the Department of State.

The former addresses Type I and Unlisted Actions in the coastal area, which require the preparation of an environmental impact statement. The amendments to Section 617.9 require State agency actions to be consistent with the coastal policies. Where appropriate, the agency would also find that its action is consistent to the maximum extent practicable with an approved waterfront revitalization program.

The Department of State's regulations cover Type I and Unlisted Actions in the Coastal Area which do not have a significant effect upon the environment. Specifically, the filing of a certification of consistency with the Secretary of State will be required for direct and funding actions. A similar certification will be necessary for all actions where an approved local waterfront revitalization program is in effect.

Section 600.5 of the department's regulations contains the coastal policies which are to be used in determining the consistency of a proposed action.

The principal advantages of using these procedures to implement the State consistency provisions are described in Part III.

C. ECONOMIC

Federal approval of the State's Program may result, subject to Congressional appropriations, in increased federal financial assistance for program administration and managing coastal resources. Program approval would also mean grants may be available, subject to Congressional appropriations, for responding to anticipated impacts of coastal energy activity under Section 308, the Coastal Energy Impact Program. The federal act also authorizes grants for marine and estuarine sanctuaries. Available federal funds may be used to improve the capacity of the State and local governments to manage New York's coastal resources. Also, these federal dollars, matched by State funds, may provide the impetus for waterfront revitalization projects which will have local and possibly regional economic benefits.

The State's Coastal Management Program is likely to have a dramatic and positive economic impact on the development of complex, natural resource-based industries such as commercial fishing and aquaculture. Growth of the State's commercial fishing industry, for example, has been impeded by the high degree of risk and complexity associated with this particular economic activity. Private investors shy away from this industry because of erratic changes in harvest rates, complex pricing mechanisms and the difficult political context within which fishery resources are managed. Many of these risks and disincentives, however, can be reduced to acceptable levels through the State's Coastal Management Program.

The Program can make a significant contribution in developing these resources by conducting studies to identify the environmental, technical and political constraints which impede further resource development. The results of such studies can then provide the basis for preparing a resource development plan which will provide for more orderly development of the resource. Such plans are absolutely essential to creating truly new economic development opportunities rather than merely displacing existing economic activities from one geographic location to another.

The Coastal Management Program, through its coordinated decision-making process involving federal, State and local governments will more efficiently channel public sector efforts to assist private industry in development of natural resource based industries. Consensus among government agencies on development objectives can now be more readily achieved. Also, a significant reduction of political constraints and associated regulatory delays will result as the various government agencies come to agreement on development strategies. These reductions in political constraints, coupled with joint federal and State financial assistance, should create sufficient incentive for attracting private investment in appropriate development of our natural resources.

A net gain in the number of jobs in the State may be anticipated as a result of the Coastal Management Program. First, program policies do not infringe on existing economic activities and, therefore, no existing jobs should be lost. Further, as a consequence of Program support for new coastal-related enterprises, employment levels can be expected to rise. Such enterprises include fishing, agriculture, recreation and tourism industries as well as ports, boat construction and other concerns requiring waterfront space. Finally, by improving the natural and economic environment of coastal areas, the Program should help to improve the entire State's image as a good place in which to develop new enterprises and thus new jobs.

As a result of new water-related development, it may be necessary for localities to make major capital investments for infrastructure and building rehabilitation. Such investments are likely due to the Program's emphasis on channeling growth to developed areas where existing infrastructure can accommodate growth.

Local tax revenues will also be affected as a result of water-related development and nautical protection policies of the coastal program. The designation by local governments of certain coastal areas for water dependent development may increase property tax revenues from these areas. This new development may reduce the value of adjacent properties if the new and existing adjacent uses are incompatible; but such a reduction will be minimized by careful selection of sites for industrial and commercial development which would be compatible with the existing adjacent uses.

The identification of some coastal areas for protection and preservation may limit property tax revenues from those areas; however, the natural and aesthetic qualities of protected areas may increase the value of adjacent or nearby property, especially residential and commercial property.

Coastal management policies directed particularly at identifying and managing erosion and flood hazard areas may, in the short term, reduce tax revenues to the extent that more stringent development restrictions on private property will reduce the value of the property, and therefore the property tax revenues. However, in the long term, identification of these areas should have beneficial impacts by preventing unwise development and thus eliminating or reducing the need for government disaster relief as well as expenditures to replace, repair or reconstruct damaged roads, sewers and other infrastructure.

D. DEVELOPMENTAL

The Coastal Management Program is committed to encouraging growth in already developed areas or in areas where development can be concentrated and adequately served by public facilities. This policy is based on the belief that concentration of development will not only protect the environment but also strengthen the economy of the State. While the Program intends to accomplish its objectives in part by using certain restrictive measures, such as the State's wetlands and erosion laws, its goals will be achieved primarily by undertaking the more affirmative activities outlined in the Waterfront Revitalization of Coastal Areas and Inland Waterways law and the policies section of this document. Such activities include permit expediting, identification of suitable development sites, and State and federal consistency.

By implementing these activities, the Coastal Management Program will assist in intensifying development in existing population and commercial centers. This will reduce development pressures on ecologically sensitive areas, particularly in non-urban communities, but will not automatically preclude development in these areas, since local governments retain their powers to make land use decisions.

E. ENERGY

No negative effects on energy use and development are expected as a result of implementing the Coastal Management Program. On the contrary, the Program recognizes the importance of adequate energy supplies for the economic development of the State. It also recognizes the possible national interest in locating energy production facilities in the coastal area. To ensure that such facilities are developed with satisfactory environmental safeguards, the Department of State will participate, as appropriate, in the processes for siting transmission lines and electric power plants under Articles VII and 10 of the Public Service Law, in State Environmental Quality Review Act procedures, and in other review procedures.

The Program encourages, subject to existing State environmental controls, development of additional energy resources in the State and recognizes that development of Outer Continental Shelf (OCS) and Lake Erie resources could be of moderate benefit to New York State in meeting its goal of energy self-sufficiency. This development must, however, be subject to strict environmental controls.

In regard to energy conservation, the Program advocates concentration of new development in appropriate areas, which may help to reduce future energy consumption for transportation. Also, any rejuvenation of port facilities may result in shifts to use of water transportation for some commodities. Because ships and barges are an energy-efficient means of transportation, some conservation of energy may be a consequence of the Program's policy to favor port development.

F. SOCIAL

The Program is expected to have a favorable social impact. The Program seeks to create a heightened awareness of the relationship between land and water and between people and their environment. As a result, they will be able to make decisions that will ultimately improve the quality of life along the waterfront. A deteriorated waterfront is an economic and psychological burden; but a vibrant waterfront area can serve as a catalyst for area-wide economic rejuvenation and foster a sense of community pride.

A positive social impact will result from the policy of favoring redevelopment of waterfront areas. Revitalized urban coastal areas will draw people back to the urban center. Thus, there will be greater opportunities for positive social interaction.

Another favorable social impact will result from the Program policies to increase public access to the shore. The poor and less mobile people have often been denied the opportunity to enjoy the State's coastlines. Improved public transportation, more public access points and increased amounts of park acreage will contribute to more use of the shore by all segments of the population.

A possible negative social impact of the Program would be perceived infringement on private property rights brought about by governmental efforts to increase public access to the coast. The Program recognizes that some fears are justified; however, it advocates that efforts to increase public access be undertaken judiciously, without limiting property rights and without taxing the carrying capacity of any given resource.

PART VI. AGENCIES CONSULTED

Implementation of the most formal means of consultation with those identified as having an interest in the development of the State's Program was achieved by forwarding to them for review, copies of the March 1979 Draft Coastal Management Program Report. Copies of the Draft New York City Local Coastal Management Program were sent also to certain federal agencies, to State agencies and to other local and non-governmental groups. In June 1982, the Coastal Management Program and Draft Environmental Impact Statement, as well as the New York City Waterfront Revitalization Program, were sent to federal, State and local government agencies and to other national, State, and local interested parties.

Degrees: Bachelor of Management Engineering, Rensselaer Polytechnic Institute, 1955 (Minor - Civil Engineering)
M.S. - Columbia University, 1959, Economic Geography
Ph.D. - Clark University, 1965, Geography

Experience: 6 years, NYS Department of State, Coastal Management Program
10 years, professional experience in engineering, geography, and planning with public planning agencies, universities, and as private consultant

Kevin A. Crawford, Senior Attorney, NYS Department of State

Degrees: B.S. - Union College, Schenectady, 1975, Civil Engineering
J.D. - New England School of Law, Boston, 1978

Experience: 3 years, NYS Department of State, Division of Legal Services

James A. Coon, Principal Attorney, NYS Department of State

Degree: B.A. - Cornell University, 1965, Economics
LLB - Syracuse University College of Law, 1968

Experience: 12 years, New York State planning agencies (Office of Planning Coordination, Office of Planning Services, Department of State), extensive experience in land use regulations

Diane Hamilton, Coastal Public Participation Specialist, NYS Department of State

Degrees: B.L.A. - State University of New York, 1976, Landscape Architecture
B.S. - State University of New York, 1975, Environmental Science
B.A. - Boston University, 1968, French

Experience: 3 years, NYS Department of State, Coastal Management Program
2 years, Environmental Planning Lobby

Alan C. Lillyquist, Coastal Resources Specialist, NYS Department of State

Degrees: B.S. - University of Wisconsin, 1963, American Institutions
M.U.P. - University of Illinois, 1970, Urban Planning

Experience: 61/2 years, NYS Department of Environmental Conservation and NYS Department of State, Coastal Management Program
51/2 years, other professional planning experience with NYS Office of Planning Coordination and NYS Department of Environmental Conservation

Neil MacCormick, Coastal Resources Specialist, NYS Department of State

Degrees: B.A. - Cornell University, 1958
M.A. - University of Chicago, 1961

Experience: 6 years, NYS Department of State, Coastal Management Program
13 years, international banking

David M. Markowitz, Senior Planner, NYS Department of State

Degrees: B.A. - State University of New York, Stony Brook, 1971, Political Science

Experience:	M.U.P. - New York University, Graduate School of Public Affairs, 1975, Urban Planning 4 years, NYS Department of State, Coastal Management Program 3 years, other professional planning experience with public and private agencies
Charles T. McCaffrey, Jr., Degrees:	Coastal Resources Specialist, NYS Department of State A.B. - St. John's Seminary, Boston, 1964, Philosophy M.U.P. - University of Illinois, Champaign-Urbana, 1970, Urban Planning
Experience:	4 years, NYS Department of State, Coastal Management Program 7 years, other professional planning experience with New York State agencies
James W. Morton, Degrees:	Coastal Resources Specialist, NYS Department of State B.A. - Hobart College, 1966, English M.A. - State University of New York at Albany, 1967, English M.S. - Cornell University, 1975, Fishery Biology
Experience:	5 years, NYS Department of State, Coastal Management Program
George R. Stafford, Degrees:	Coastal Resources Specialist, NYS Department of State B.S. - State University of New York at Syracuse, 1973, Environmental Studies B.L.A. - State University of New York at Syracuse, 1974, Landscape Architecture.
Experience:	6 years, NYS Department of State, Coastal Management Program 2 years, other professional experience in public and private sector - landscape architectural design
NYS DEPARTMENT OF ENVIRONMENTAL CONSERVATION, EROSION CONTROL REGULATIONS STAFF:	
Terry Crannell, Degrees:	Associate Water Management Program Coordinator, NYS Department of Environmental Conservation B.S. - State University College of New York at Brockport, 1973, Biological Sciences M.S. - Rensselaer Polytechnic Institute, 1975, Urban and Environmental Studies
Experience:	7 years, NYS Department of Environmental Conservation
William W. Daley, Degrees:	Chief, Coastal Erosion Section, NYS Department of Environmental Conservation B.S. - Pennsylvania State University, 1962, Civil Engineering M.S. - Stanford University, 1963, Water Resources
Experience:	10 years, NYS Department of Environmental Conservation in Flood Plain Management, Coastal Protection

NEW YORK CITY LOCAL WATERFRONT REVITALIZATION PROGRAM STAFF:

Harold Goldman, Deputy Counsel, New York City Department of City Planning
Degrees: J.D. - State University of New York at Buffalo, School of Law, 1975
B.A. - State University of New York at Buffalo, 1972, Environmental Studies
Experience: 5 years, Alaska, New York, land use and environmental law

Holly Bruno Haff, Deputy Director, Environmental Management Division, New York City Department of City Planning
Degrees: B.S. - University of Oregon, 1970, Architecture
M.A. - University of Hawaii, 1979, Geography Experience: 3 years, New York City, architecture
Experience: 3 years, New York City, architecture
4 years, Hawaii and New York City, environmental planning

Joseph W. Ketas, Director, Environmental Management Division, New York City Department of City Planning
Degrees: Bach. Civil Eng. - University of Detroit, Engineer
Assoc. Civil Eng. - University of Scranton, Engineer
Experience: 9 years, New York City Department of City Planning, Environmental Planning Director, City Environmental Quality Review Program

PART IX. RESPONSES TO COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

This part contains responses to all comments on the Draft Environmental Impact Statement (DEIS) received either in writing or at the federal public hearings during the official review period (June 11, 1982 through July 26, 1982). The State and federal responses to these comments have been coordinated between the New York State Coastal Management Program and the federal Office of Coastal Zone Management.

No attempt has been made to distinguish between comments made on the DEIS and those made on the Coastal Program, primarily because of the combined format of the document and the interrelated nature of most comments received.

Some comments have resulted in specific changes to the text of the DEIS. Those changes have been made to the appropriate pages of the DEIS. Likewise, the revisions have been noted in response to the various comments and are reflected in the Final Environmental Impact Statement.

Written comments were received from thirty government agencies and individuals. In addition, seventeen individuals or agency representatives testified at three public hearings on the DEIS.

This section is divided into three sections:

- I. Responses to Federal Agency Comments on the DEIS
- II. Responses to State and Local Written Comments on the DEIS
- III. Responses to Testimony Received at Joint Federal and State Public Hearings on the DEIS

Page references in all comments are to the DEIS. Page references in all the responses are to the FEIS, unless otherwise noted.

Within the sections, individual commentators are indicated by capital letters. An index of commentators is provided on the following page.

INDEX OF DEIS COMMENTATORS

SECTION 1 - RESPONSES TO FEDERAL AGENCY COMMENTS ON THE DEIS

- A. U.S. Department of Agriculture, Soil Conservation Service
- B. U.S. Department of Defense, Army Corps of Engineers
- C. U.S. Environmental Protection Agency, Region II
- D. Federal Energy Regulatory Commission
- E. U.S. Department of Housing and Urban Development
- F. U.S. Department of Interior
- G. Nuclear Regulatory Commission, State Relations Section
- H. U.S. Department of Transportation, Office of Economics, U.S. Coast Guard I.
- I. U.S. Department of Transportation, Federal Aviation Administration

SECTION 2 - RESPONSES TO STATE AND FEDERAL WRITTEN COMMENTS ON THE DEIS

- A. William C. Hennessy, Commissioner, N.Y.S. Department of Transportation
- B. Mary P. Bass, N.Y.S. Metropolitan Transportation Authority
- C. Anthony Tozzoli, Director, Port Department, The Port Authority of New York and New Jersey
- D. Robert D. Vessels, Director, Office of Environmental Planning, N.Y.S. Department of Public Service
- E. Louis M. Conera, Jr., Director, Division of Regulatory Affairs, N.Y.S. Department of Environmental Conservation
- F. Joseph P. Fraioli, Village Manager, Mamaroneck
- G. Edith A. Mesick, Planning Director, Columbia County Planning Department
- H. Frances F. Dunwell, Scenic Hudson, Inc.
- I. Samuel H. Sage, Executive Director, Sierra Club - Atlantic Chapter
- J. Sarah L. Johnston, Hudson River Sloop Clearwater, Inc.
- K. Bryan Luftglass, Sierra Club, Westchester-Putnam Group
- L. William E. Miller, United Mobile Sportsfishermen, Inc.
- M. Bernard J. Blum, Friends of Rockaway, Inc.
- N. Frank R. Seddio, District Manager, Community Board No. 18, Brooklyn, New York
- O. Nancy Nagel Kelly, Planner, Group for the South Fork, Inc.
- P. Howard Golden, President of the Borough of Brooklyn, New York
- Q. Hilda Regier, Rose Mary Lynch, Community Board No. 4, New York, New York
- R. John W. Meunzeinger, Westchester County Department of Planning
- S. Thomas La Manna, Community Board No. 1., Staten Island, New York
- T. Daniel J. Palm, Executive Director, St. Lawrence-Eastern Ontario Commission
- U. Bonnie June Mellon

SECTION 3 - RESPONSES TO TESTIMONY RECEIVED AT JOINT FEDERAL AND STATE PUBLIC HEARINGS ON THE DEIS

- *A. Charlene Calle, representing County Executive Edward J. Rutkowski, Erie County
- *B. David Stebbins, Division of Planning, Buffalo
- *C. Frances F. Dunwell, New York Coastal Coalition
- D. Bernard Melewski, N.Y.S. Environmental Planning Lobby
- E. Frances Hodson, Long Beach
- *F. Aurora Gareiss, Udalls Cove Preservation Committee, Citizens Advisory Committee, Governing Board on Water Resources
- *G. Mark Wainstock, Neighborhood Organizations and Citizens Outraged Against Lignite (NO COAL)
- *H. Sister Frances Gerard Kress, CSJ, Environmental Protection Committee of Community Board No. 1, Brooklyn, and Greenport Civic Council
- *I. Virginia M. Dent, N.Y.S. Northeastern Queens Nature and Historical Preserve Commission
J. Bea Green, New York, New York
- *K. Sarah Chasis, Natural Resources Defense Council

- *L. Joseph Landau, representing Howard Golden, Brooklyn Borough President
- *M. Marilyn Vogel, N.Y.C. Advisory Committee on Water Resources
- *N. Thornton Willett, Kane Street Block Association
- O. Agnes Hentschel, Woodside, New York
- P. Robert Alpern, N.Y.C. Citizens Advisory Committee on Water Resources
- *Q. Maurice Hinchey, Member of New York State Assembly, Chairman of Assembly Environmental Conservation Committee

* Written comments received

SECTION 1 – RESPONSES TO FEDERAL AGENCY COMMENTS ON THE DEIS

A DEPARTMENT OF AGRICULTURE

Peter Myers
Soil Conservation Service

- 1 COMMENT: We are pleased to note the attention given to the protection of agriculture. Your policy is consistent with USDA land use policy and with the Farmland Protection Policy Act, PL 97-98. USDA will provide all possible assistance in administering the NY CZMP.

RESPONSE: Thank you.

- 2 COMMENT: On page 248, change “one or more parts” to “two or more parts”.

RESPONSE: See correction.

- 3 COMMENT: On page 248, the listing a through c would be strengthened by adding “residential uses other than farm dwellings”.

RESPONSE: The guidelines have been revised to include the above.

B DEPARTMENT OF DEFENSE

Colonel Robert K. Turner
Army Corps of Engineers

- I COMMENT: On page 75, under “Coastal Issues”, the statement that “...adequate economic and environmental information exists to demonstrate the un-justifiability of any season extension...” is not supported by the facts. The statement is apparently the opinion of some of the State of New York officials. A complete discussion of the winter navigation/season extension proposals, including the findings and recommendations of the Corps of Engineers, should be presented.

RESPONSE: The State has changed its wording to indicate there is inadequate information at this time to demonstrate the justification of any season extension. No projects are specifically prohibited in this coastal program; all proposals will be evaluated for

consistency with the 44 policies. The State will consider information by the Corps in making their decisions.

- 2 COMMENT: On page 131, Policy 3.A.2 implies that development of the major ports will be limited to improving “established” alignments and “existing” channels. There may be a need in the future to establish new alignments and new channels to improve the major ports. This future need should be recognized, and the document revised accordingly.

RESPONSE: See revision.

- 3 COMMENT: On page 149, Policy 7 provides that the New York State Fish and Wildlife Habitat Rating Guide dated January 1981 will be the standard for determining habitat significance. a) The procedures for identifying significant habitats should be clearly defined. The proposed designation of significant habitats should be coordinated by the State with the Federal and public agencies, such as the U.S. Army Corps of Engineers, the St. Lawrence Seaway Development Corporation, and others. b) Key information from the 1981 habitat rating guide should be included in the Coastal Management Program to enable Federal agencies to review the impact of the application of the rating guide on their own activities. Pertinent information that should be included in the program document should focus on how procedures were established for rating, how significance is determined for each of the five parameters used, a definition of “significance”, and those Federal and public agencies with which the rating system report was coordinated before finalizing.

RESPONSE: Additional information more clearly defining the procedures used for identifying significant fish and wild life habitats has been added to Explanation of Policy #7. See revisions. The process of applying the rating system and formally designating significant habitats will occur during the first year of program implementation. Prior to formal designation, maps, a copy of the habitat rating form and narratives, if any, will be provided to Federal and State agencies and the public for review and comment.

- 4 COMMENT: On pages 337 and 338, the paragraph on Consistency Procedures for Federally Conducted or Supported Activities should be revised to consider the requirement “If a Federal agency determines that a Federally conducted or supported activity does not directly affect the State coastal area, and thus a consistency determination is not needed, the agency should notify the Department of State at least 90 days before final approval of the activity, setting forth the reasons for its negative determinations” is a duplication and should be deleted. As provided elsewhere in the paragraph, for activities listed in Table 2, the Federal agencies will make a consistency determination and report findings through existing mechanisms, such as OMB Circular A-95 and NEPA documents. If it is determined that the activity does not directly affect the State’s coastal area, it will be supported in these documents. Also, subparagraph 2 on page 337 provides that activities not listed in Table 2 will be monitored through the A-95 review process and other relevant processes by the State, and that the Department of State will notify the Federal agencies if a consistency determination and review is needed.

RESPONSE: Agreed. The paragraph is deleted.

5. COMMENT: The following provision should be added at the end of the next to last subparagraph on page 338: “The Federal agency may presume State agency agreement if the State agency fails to provide a response within 45 days from receipt of the Federal agency notification.”

RESPONSE: Agreed. See revision.

6. COMMENT: On Page 347, it is incorrect to list the Corps of Engineers programs in Part III of Table 2 under the “Federal Assistance” program; the Corps is not a granting agency. The Corps programs are appropriately listed in Part I of Table 2 as “Direct Federal Activities and Development Projects”.

RESPONSE: See revision.

C. ENVIRONMENTAL PROTECTION AGENCY

Anne Norton Miller

Region II, New York, New York

1. COMMENT: It is important that the State Environmental Quality Review Act (SEQRA) process be amended prior to issuing the final CMP EIS to ensure that local and private actions are consistent with the New York State Department of State (NYSDOS) coastal policies through the SEQRA process.

RESPONSE: Proposed amendments to the SEQRA regulations were contained in APPENDIX A of the DEIS. These amendments, as well as proposed DOS regulations to implement the Waterfront Revitalization and Coastal Resources Act (WRCRA), must be adopted prior to Federal approval of the NYCMP. A statement to this effect was included on page 54 of the DEIS and is in the FEIS, page II-4-12.

2. COMMENT: ...we recommend that a mechanism be established (a) to resolve possible conflicts between agencies, (b) to ensure compliance with the intent of CMP, (c) to coordinate existing programs and (d) to advocate specific desired activities.

RESPONSE: Section 919.1 of the WRCRA requires actions directly undertaken within the coastal area by State agencies to be consistent with the coastal policies. The NYCMP will rely on third party enforcement of Section 919.1 of the WRCRA. A third party may seek judicial review of a State agency’s determination of consistency pursuant to Article 78 of the NY Civil Practice Law. This technique meets the requirement established by 15 CFR Section 923.43 which states, in part, “It will be sufficient if any of the following can act to ensure compliance: The State agency designated pursuant to subsection 306(c)(5) of the Act, the State’s Attorney General, another State agency, a local government or a citizen.”

Section 913.4 of the WRCRA provides the Secretary of the NYSDOS the authority “To review, evaluate and issue recommendations and opinions concerning programs and actions of State agencies which may have the potential to effect the policies and purposes of this article, including but not limited to, programs within the jurisdiction of the Departments of State, Agriculture and Markets, Environmental Conservation, Public Service, Commerce and Transportation, the Offices of Energy and Parks and Recreation

and the Office of General Services.” The Secretary shall exercise this authority to coordinate State agency programs with an effect on the coastal area.

In addition to the implementation of voluntary LWRPs, the NYSDOS and other State agencies will advocate a number of activities central to the NYCMP. The Secretary of the NYSDOS is also instructed, under the WRCRA, to encourage public and private institutions to preserve, protect, enhance, develop and use coastal resources in a manner consistent with the purposes and policies of the WRCRA.

3. COMMENT: ...we suggest that local government be encouraged and given incentive to develop local comprehensive plans and zoning ordinances in accordance with the CMP coastal policies.

RESPONSE: The WRCRA provides the authority and incentive for municipalities to prepare programs for their coastal areas. By participating, local governments will be eligible to receive financial and technical assistance for the preparation and implementation of their waterfront revitalization programs. In addition, a major incentive of an approved LWRP is the requirement that State and Federal actions must be conducted consistent with the specific policies of the LWRP. Proposed local waterfront revitalization programs must be found consistent with the coastal policies prior to State approval (see Section 601.3(2) of the proposed DOS regulations). Comprehensive planning and zoning ordinances are two means for implementation of a local program.

The WR & CRA and DOS regulations (Part 601) and DOS guidelines for local waterfront revitalization programs require that these programs must be comprehensive, that is (1) they must include the entire coastal area of the locality, (2) they must be consistent with and further all applicable coastal policies (28 of the 44 policies are referenced in Part 601 of DOS regulations and 16 are found in other State laws to which localities must adhere or which do not relate to local government activity), and (3) the locality must have adequate legal authority, including appropriate land use controls, to implement the program. The guidelines for local waterfront revitalization programs (Appendix B) contain the most complete description of what a LWRP must be.

With regard to coordination of activities in areas where some communities have local programs and others do not, and the voluntary nature of such programs, the NYS CMP is a State program with adequate authority to implement all policies. Where a community wishes to participate by adopting and further detailing State policies, it is encouraged to do so. Where a community does not participate, all State coastal policies apply. Where a Federal action subject to consistency occurs in an area covered by both a participating and non-participating community, the more detailed policies of the participating community apply if that community’s LWRP has been added to the NYS CMP either through routine program implementation or a program amendment. Local governments may participate in the program only if they prepare a comprehensive program, they can receive project funding assistance only for priority projects specifically identified in an approved LWRP. This is described in the WR & CRA, DOS regulations, and DOS guidelines.

4. COMMENT: This concept should be carried through and mentioned in the Content of Local Program” as well (page 655).

RESPONSE: See additional discussion included (Step 5(b)) on DOS technical assistance which will be available to the localities.

5. COMMENT: The Local Program should stress in sections (2) and (4) the importance of protecting environmentally sensitive areas and natural resources in developing a local strategy in accordance with the 44 coastal policies.

RESPONSE: The importance and requirement for protecting environmentally sensitive areas and natural resources is described in Part 2, Specific Guidelines, pages B-39 to 73 of the FEIS; in particular, Significant Fish and Wildlife Habitat - page B-39; Flooding and Erosion - page B-47; Historic Resources - page B-63; Visual Quality - page B-66; and Agriculture - page B-71. Part I, Section 2 references the specific guidelines of Part II.

6. COMMENT: We recommend that the draft EIS include (a) a time frame or notification of the NYSDOS by the involved State agencies and other parties when coastal issues are involved and (b) what type of legal or other action NYSDOS could take if it found a project inconsistent with the coastal policies.

RESPONSE: (a) The Coastal Assessment Form, page A-4 of the FEIS, and the SEQRA, page A-3 will assure NYSDOS is adequately informed, (b) See response to comments 2a and 2b above.

7. COMMENT: We recommend that (a) regional concerns be described, (b) GAPCs designated, and (c) procedures for GAPCs be identified for inclusion in the final EIS.

RESPONSE: (a) Pages 11-2-1 through 11-2-13 of the FEIS describe the most regional concerns of the three major regions of the New York coastline, (b) three categories of GAPC's (which the NYCMP refers to as Special Management Areas) were identified in the DEIS: State parks, Estuarine Sanctuaries and LWRPs. This fulfills the requirements of 15 CFR 923.21, (c) a reference to the criteria and procedures for designation of areas for preservation (APRs) has been included in the introduction to Part II, Section 8, of the FEIS.

8. COMMENT: The draft EIS for the subject program should identify the relationship and procedures for coordination between the CMP and applicable State and local agency air quality plans pursuant to 15 CFR Section 923.56. Procedures for coordination should be more specific, clarifying the statement in the draft EIS that "mutual program review will concentrate on identification of the effect of each program upon the other." By explicitly stating procedures of coordination (e.g. for air quality management), the effectiveness of the voluntary participation in the CMP by local agencies will be increased.

RESPONSE: As to coordination with applicable State and local air quality p a, the NYSCMP at several stages was thoroughly reviewed by NYS DEC, Division of Air Resources. All comments suggested, additions and deletions were fully incorporated in FEIS. Any future revisions or changes to applicable State air quality plans will be subject to review procedures to ensure consistency with coastal policies, including the policy requiring adherence to the Clean Air Act as a minimum. Furthermore, the preparation of local waterfront revitalization programs will undergo review by applicable State and local agencies to ensure that the program is not contrary to existing air quality plans.

9. COMMENT: It is recommended that the plan provide a clear statement that the requirements of the Clean Air Act (CAA) are the minimum air pollution control requirements applicable within the coastal zone. Also, the CMP should incorporate the air pollution control requirements pursuant to Section 307(f) of the Coastal Zone Management Act. The CMP should provide explicit, legally binding procedures for ensuring that the requirements of the CAA are not impaired.

RESPONSE: The explanation of Policy 41 is amended to state clearly the requirements of the Clean Air Act are the minimum air pollution control requirements applicable within the coastal area, and that all requirements of the State pursuant to the Clean Air Act are incorporated (by reference) in the CM program.

As to ensuring that CMP will not impair the requirements of CAA, the WRCRA provides that “nothing in this Article shall be construed to authorize or require the issuance of any permit, license, certification or other approval...which is denied by the State agency having jurisdiction pursuant to other provisions of law or which is conditioned by such agency pursuant to other provisions of law until such conditions are met.”

10. COMMENT: CMP should discuss the relationship between its growth policies and those being implemented pursuant to the air quality plans, where applicable.

RESPONSE: The above provisions of Article 42 also govern the relationship of CMP development policies with air quality plans, that is, the development policies are limited by all other coastal policies including provisions of law relating to air quality.

11. COMMENT: The program should expand the identification of whether the air quality control region (AQCR) within the coastal zone is meeting primary and secondary National Ambient Air Quality Standards (NAAQS) by referencing the Code of Federal Regulations 40 CFR Part 52 Section 52, 1682 and by discussing how, in general, air quality considerations will be factored into the coastal decision-making process. The CMP should encourage reliance on new source reviews of major emission sources as one of the initial, major determinants of the permissibility of certain uses. The CMP should recognize the potential adverse air quality impacts (primary and secondary) of smaller scale commercial and residential development which are not subject to new source review.

RESPONSE: With regard to points raised, the NYS CMP incorporates by reference the requirements of the CAA as the minimum pollution requirements and all requirements of the State pursuant to the CAA. Further elaboration is not required for approval under the CZMA.

12. COMMENT: Identification should be provided on how the CMP would provide for coordination with the Federal permitting processes in areas of the coastal zone where one or more local agencies are not participating while other local agencies are participating.

RESPONSE: The NYSDOS, as the single State agency identified pursuant 15 CFR 923.53 responsible for consistency review of proposed Federal actions, is responsible for securing necessary review and comment from other State, regional, or local government agencies. It is the only State agency authorized to comment officially on a Federal consistency determination, concur with or object to a consistency certification, or determine the

consistency of a proposed Federal assistance activity, regardless of whether local governments participate in the NYCMP (See 15 CFR 930). Where local governments have approved LWRPs, these plans will provide more specific policies in addition to the Statewide policies for the NYSDOS to consider in making its Federal consistency comment review. See also response to comment 3, above.

13. COMMENT: The CMP should indicate if it is possible for a local agency to participate only in particular projects of its choosing (with full or limited funding).

RESPONSE: See response to comment 3 above.

14. COMMENT: In general, it is felt that voluntary participation in the subject program by local agencies will reduce the effectiveness of the overall CMP. It appears that local non-participation may be offset to some extent by State authority in the areas of erosion hazards and water dependent uses, due to recent State legislation. However, the air quality management program will still be largely dependent upon the NYS Department of Environmental Conservation. This may become the case in both participating and non-participating local areas unless the CMP identifies and implements procedures for coordination in these areas.

RESPONSE: The NYCMP is sufficiently comprehensive and specific at the State level, and therefore needs to be strengthened and/or made more specific and predictable only where a locality feels it necessary to ensure that its priorities are met. The approval of a LWRP does not substitute for or replace the authorities or controls of the State over coastal resources. Instead, LWRPs will provide additional specificity in policies and priorities for the relevant coastal area.

You are correct that the program does not alter the air quality program, but incorporates it as mandated by 307(j) of the CZMA.

15. COMMENT: The description entitled “Implementation” under Policy 39 needs to be updated to reflect that assistance to states for state solid waste plan development and for resource recovery feasibility under Section 4008 of the Resource Conservation and Recovery Act ceased effective October 1, 1981.

RESPONSE: Neither NYC nor NYS policy 39 refers to this program.

16. COMMENT: In addition, New York State has not submitted a final statewide solid waste plan to EPA for approval, and indications are that no plan will be submitted prior to January, 1983.

RESPONSE: No response necessary.

17. COMMENT: Executive Orders 11988 (Floodplain Management) and 11999 (protection of wetlands) provide for protection of floodplain and wetland areas: (a) With regard to Policy 44, we believe it is important to provide additional consideration to protect freshwater and tidal wetlands less than 12.4 acres in sites that are unique or of local significance to be consistent with these executive orders, (b) in the description of “Content of Local Program,” freshwater and tidal wetlands should be included in the list of environmentally sensitive areas to be inventoried and afforded protection.

RESPONSE: (a) The 12.4 acre threshold only applies to freshwater wetlands; not tidal wetland areas. The majority of freshwater wetlands which are less than 12.4 acres in size and that are unique or of local significance are afforded protection by this law or under the Protection of Water Laws Act. See discussion of this implementing authority on pages 11-6188.

All freshwater and tidal wetlands that are unique or are of local significance and that meet the criteria described under Policy 7 for designation as a significant habitat, pages II-6-35 to 41 will be mapped on the Coastal Area map, (b) Wetland protection is fully covered by the wetlands laws and the Stream Protection Act.

D. FEDERAL ENERGY REGULATORY COMMISSION

Carl N. Shuster, Jr., Ph.D.
Coordinator, Coastal Affairs

1. COMMENT: In general, the proposed procedures and policies raised no serious problems directly related to energy facility development.

RESPONSE: No response necessary.

2. COMMENT: In the New York City program we are particularly concerned about prohibition of facilities associated with liquefied natural gas (LNG) tankers. The prohibition is not based on defensible standards and does not provide sufficient justification. Furthermore, we believe such an outright prohibition conflicts with sections 306(b)(8) and 306(c)(8) of the CZMA.

RESPONSE: This policy has been revised. It does not prohibit LNG facilities, but requires consideration of State and national energy needs, public safety concerns and the necessity for a shorefront location. As is noted in Appendix C on page 50, New York City has two functioning LNG plants.

3. COMMENT: Revisions to list of Federal Licenses and Permits are submitted.

RESPONSE: These revisions are incorporated.

4. COMMENT: There is no statement in the energy facility siting process indicating that Federal review and approval is necessary for hydroelectric generation facilities.

RESPONSE: In this section there is no mention of the variety of Federal reviews that are needed for most of the facilities described. To repeat all the Federal reviews would add unnecessary length to the document.

5. COMMENT: The 1: 48,000 scale maps were not distributed with the DEIS and thus the requirements of 923.31(a)(8) are not met.

RESPONSE: 923.3.(a)(i) requires that the State must be able to advise interested parties whether they are within the boundary within 30 days. The text of the Boundary Section gives the reader an understanding of whether they are within the coastal zone. During the first year of program implementation the State will submit the detailed boundaries to Federal agencies.

E. HOUSING AND URBAN DEVELOPMENT

Stephen J. Bothinger

1. COMMENT: Our staff consulted with the State staff responsible for development and preparation of the CZMP at frequent intervals over the past several years. We have had opportunity to review and comment on applicable chapters. All HUD suggestions have been incorporated.

RESPONSE: No response necessary.

2. COMMENT: We endorse the proposals and recommend approval. We plan to begin immediate steps to continue our coordination with the State after approval of the program.

RESPONSE: No response necessary.

F. DEPARTMENT OF INTERIOR

J. Robinson West

Office of the Secretary

1. COMMENT: Notwithstanding the significant achievement represented by this program, the Department has several major concerns.

RESPONSE: See responses below.

2. COMMENT: The State's policy 29 to "encourage the development of energy resources on the OCS" appears to be inadequate to meet the CZMA because it lacks an implementing mechanism at either the State, regional or local level. We believe the State could resolve our concern by including an OCS oil and gas-specific discussion in the section of the Energy Facility Planning Process which covers assessment of energy site suitability.

RESPONSE: See revised section on Energy Facility Siting Process.

3. COMMENT: If the State allows local or regional coastal plans to include site suitability assessment procedures, these plans should be considered amendments to the State plan.

RESPONSE: All local programs must be consistent with the 44 State policies, including Policy 29. In the event a local program would propose a site suitability assessment procedure for OCS facilities that would significantly differ from guidelines contained in Appendix B, such local program would be considered an amendment.

4. COMMENT: The question of what, if any, OCS leasing activities "directly affect the coastal zone is in litigation. The FEIS should indicate the State reserves the right to request consistency determinations pending outcome of the legislation.

RESPONSE: While the appeal is pending in the Ninth Circuit Court Appeals on the question of which OCS activities directly affect the coastal zone, the State intends to review leasing activities as stated in the DEIS.

5. COMMENT: It must be made clear to the State that Section 307(c)(1) of the CZMA regulations requires the head of the responsible Federal agency to determine whether an agency program activity outside the coastal zone directly affects the coastal zone.

RESPONSE: See revised section which clarifies this point.
6. COMMENT: We do not believe it is appropriate to list “operating orders” as a Federal activity that is subject to consistency review.

RESPONSE: Operating Orders have been deleted.
7. COMMENT: Policies 11 through 17, which deal with barrier island structures, while recognizing their protective value against flooding and erosion, do not consider that these features are actually shifting position.

RESPONSE: The shifting position of the beaches is more fully described in Section 5, Coastal Issues. It would be redundant to repeat the description again.
8. COMMENT: The NYCZMP should be expanded to include provisions supporting sand and gravel mining.

RESPONSE: See Policy 15 and additional information added in Section 5.
9. COMMENT: There has been inadequate Federal-State coordination in preparation of the program.

RESPONSE: Appendix C adequately documents Federal-State consultation. In addition to statewide public hearings, copies of various drafts have been sent to Federal agencies with requests for comments. Ongoing consultation will continue during program implementation.
10. COMMENT: The environmental analysis of the NYCZMP is more of an explanation and rationalization of the proposed program than it is an analysis. It says future impacts will be recognized by the EIS but does not document them.

RESPONSE: The document adequately describes and analyses the impacts of the proposed program. In any situation when discussing likely future impacts, the impacts cannot be documented.
11. COMMENT: Page 20, Paragraph 3 - DOI suggested updated statistics.

RESPONSE: See revisions, suggestion incorporated.
12. COMMENT: Page 24 - The Hudson River is used as a drinking water source by Poughkeepsie.

RESPONSE: See revisions, suggestion incorporated.
13. COMMENT: Page 25, Paragraph 3 - suggests addition of two fish.

RESPONSE: See revisions, suggestion incorporated.

14. COMMENT: Page 27 Paragraph 3 - identify lake sturgeon and add information on stocking program and hatchery.
RESPONSE: See revisions, suggestion incorporated.
15. COMMENT: Page 46 - All potential and existing pollutant sources should be determined and recorded to the extent possible.
RESPONSE: To do so would add unnecessarily to the length of the document and is not a requirement for approval under the CZMA.
16. COMMENT: Page 49 - Continued interagency involvement is essential. The NPS can better inform its visitors of such issues with better inter-agency coordination.
RESPONSE: See revision, suggestion incorporated.
17. COMMENT: Page 63 - A discussion of mineral resources should be included in Section 5 - Coastal Issues. The NYCZMP should indicate basic mineral information and describe how the program supports necessary mining activities.
RESPONSE: See expanded discussion of sand and gravel extraction in Section 5
18. COMMENT: Page 70 - This section should address the impact of pollutants upon the developing salmonid fishery of Lake Ontario.
RESPONSE: These impacts are addressed in paragraphs 1, 2, & 3 of page II-5-7.
19. COMMENT: Page 74 First Paragr4.0 - Text should be changed to reflect difference inT70En Long Island and Lake Ontario.
RESPONSE: See revision, suggestion incorporated.
20. COMMENT: Page 77 Fourth Paragraph. Indicate that Lake Ontario Shoreline Protection Study is looking into means of providing cost-sharing for shoreline protection.
RESPONSE: See revision, suggestion incorporated.
21. COMMENT: Pages 131-133 - In view of the Fish and Wildlife service, landfill projects in the near-shore areas of a major port may not always be acceptable even if the adverse impacts are minimized.
RESPONSE: The CZMA does not affect the Services responsibilities to deny permits where it determines them inappropriate. We are anticipating that the NYCZMP will serve to help coordinate various Federal and State agencies with overlapping responsibilities and that all efforts to resolve such differences will be attempted.
22. COMMENT: Page 141 - This pace should either be deleted or more clearly define why certain types of development are exempted and what constraints still do apply.
RESPONSE: The reasons why these are exempted are clearly stated in the text. All the other coastal policies except Policy 5 still apply to these eight exempted uses.

23. COMMENT: Page 155 - Non-point source pollution should be recognized in the impact analysis of this policy.
RESPONSE: See additions made.
24. COMMENT: Page 167 - We support Policy 11, but caution that long range trends of erosion and accretion may be erratic.
RESPONSE: Agreed. This difficulty is recognized in the “Shoreowners Protection Act” by the required review of recession rates every ten years or less if warranted.
25. COMMENT: Page 175 - We do not believe the State or this CZMP can establish a scientifically justified success probability to determine what is a reasonable probability “of erosion control success”. Natural sediment re-establishment should be considered.
RESPONSE: While it may be difficult to define absolutely “reasonable probability” the intent of the policy and of “the Shoreowners Protection Act” is clearly to impose performance standards on the use of erosion control structures. Natural sediment budget re-establishment has been considered and is encouraged in Policy 12.
26. COMMENT: Page 185 - Protecting existing man-made structures are generally costly, ineffective and counterproductive on natural barrier islands. Numerous existing private structures on Fire Island could present long-term problems.
RESPONSE: The limiting nature of the policy fully accounts for the problems mentioned.
27. COMMENT: Page 187 - Reshaping natural dunes conflicts with NPS management policy at Fire Island National Seashore.
RESPONSE: The reshaping of dunes is not included in Policy 17 as a nonstructural measure. In any event, the Fire Island National Seashore is classified as excluded Federal lands.
28. COMMENT: Page 245 - Policy 26 is generally acceptable provided agricultural activities do not adversely impact aquatic and ground water systems.
RESPONSE: Agreed.
29. COMMENT: Page 265 - Energy resource recovery on the OCS could significantly impact the ocean and inner bay of Fire Island National Seashore. The impact analysis of this project should recognize such potential.
RESPONSE: See revision, suggestion incorporated.
30. COMMENT: Page 269 - The periodic adverse effects of offshore sewage sludge disposal at FIIS-NS gives us serious reservations about such offshore disposal and lead to support of Corps of Engineers’ Interagency Steering Committee.
RESPONSE: Your concerns were adequately reflected in the policy in the DEIS.

31. COMMENT: Page 279 - The guidelines established in the policy are praiseworthy but difficult, if not impossible, to enforce. We recommend local site specific dredge spoil plans and that NPS be involved where relevant.
RESPONSE: Agreed. Local site specific dredge spoil plans could be conducted with coastal management funds. A dredging plan for Long Island has been prepared by the LIRPB and ten-year plan for the Hudson River has been prepared by the Corps of Engineers.
32. COMMENT: Page 283 - This is an excellent policy to minimize non-point source discharges and could be refined by local management plans.
RESPONSE: Agreed.
33. COMMENT: Page 285 - Despite these rules and regulations, ground water contamination on Long Island is increasing. This presents a threat to Fire Island National Seashore water resources.
RESPONSE: See clarifications.
34. COMMENT: Page 297 - We concur fully with this policy. However, the impact on mosquito control programs should be considered in greater detail.
RESPONSE: Mosquito Control activities are addressed in both the Fresh Water Wetlands Act (Section 24-0701.6) and Tidal Wetlands (Section 25-0401.5) See pages 58 and 50 respectively in Volume 2 of this document for these discussions.
35. COMMENT: A list of changes to DOI agency names are submitted.
RESPONSE: Changes incorporated.
36. COMMENT: Page 336 - Federal licenses or permits are not in themselves subject to consistency, nor are OCS plans; it is the activities requiring a Federal license or permit which are subject to consistency review.
RESPONSE: See change in title and text on page II-9-14 and permits and OCS plans to reflect it in the activities.
37. COMMENT: Page 345 - “Department of Interior, Mineral (sic) Management Services”: Permits to drill are exempt from CZM review by 15 CFR 930.80, if the activity to be permitted is already subject to review in the Plan of Exploration or Plan of Development (POD) review process. OCS pipelines, gathering and flow lines described in detail in approved POD’s would likewise be exempt from further CZM review.
RESPONSE: Agreed, if it is an activity described in detail in the POD.
38. COMMENT: Page 370 (Figure 6) - It is imperative that any developmental activities be closely coordinated with Gateway National Recreation Area (GATE-NRA), as well as the U.S. Fish and Wildlife Service (USFWS).
RESPONSE: Agreed.

39. COMMENT: Page 348, 5th Paragraph. The text should indicate that not all commercial fishing in the Hudson River has been banned, but only for those species which continued testing show to contain unsafe levels of toxic materials.
- RESPONSE: See revisions.
40. COMMENT: Pages 422-423 - In coordination with the Corps of Engineers, positive steps should be taken to assure that “clean and suitable” dredge sands are not dumped at sea but used in a more useful manner (beach nourishment, etc.)
- RESPONSE: See revisions.
41. COMMENT: Page 471 - Exxon spudded its first well in the Baltimore Canyon in 1978, not 1976.
- RESPONSE: Change incorporated.
42. COMMENT: Page 482 - Policy 39, New York City Policy J). The recommendation for re-negotiation with extension of the major landfill activity in GATE-NRA is not consistent with written agreements and documented understanding by NPS that such activity will not continue beyond December 31, 1985.
- RESPONSE: Discussion of re-negotiation has been deleted. Current agreements call for the closure of Fountain and Pennsylvania Avenue landfills by 12/31/85. New York City is aware of FM, USFWS, and NPA concerns and will continue to cooperate with all Federal, State and local agencies with regard to end-use plans and future closures.
43. COMMENT: Page 632 (Item 4) - While true as far as it goes, this section deals with only the response during a given storm; a greater time frame is necessary to include the effects of stabilization of the barrier. In the next year, more will be known about how important the inlet, overwash, and wind transport processes are on Long Island based on the expected results of the Federal interagency study of beach erosion control and hurricane protection on southern Long Island.
- RESPONSE: As new management techniques appear scientifically valid, they can be incorporated into the program: we look forward to the results of this study.
44. COMMENT: Page 635 (Item aa.). There are no criteria for establishing how the “recession rate” is to be consistently measured. What is the “long term” time duration base, does it include major storms, and which line of retreat is measured “receding edge” or MLW (mean low water)?
- RESPONSE: For clarification, see Section 505.3(j); which defines structural hazard area”. The basis for the calculation of long-term recession rates includes historical aerial photography as well as current photography flown especially for this purpose, maps and field surveys. The time base for recession rate calculations is 30 years but the data will be scrutinized to ensure that major storms do not distort the record.

45. COMMENT: Page 638 (Item 11). “Toe” should be the lowest point on the slope of the dune; either where it joins the beach or in the intervening swale between the primary and secondary dunes.
RESPONSE: See revision.
46. COMMENT: Page 641 (Item b). It is very difficult to establish or document in advance that a proposed structure will (or will not) cause a measurable increase in erosion rates nearby.
RESPONSE: Given the other two criteria that must be met, this standard appears reasonable. The burden of proof is on the applicant to show no measurable increase.
47. COMMENT: Page 645 (Item 7). What is the penalty and means for enforcement of these provisions to limit use of motorized vehicles on beaches?
RESPONSE: The “Shoreowner’s Protection Act” contains no provisions for penalties. However, the municipal, county or State agency administering local erosion programs has available various legal sanctions to impose on violators of any of the sections of the Act.
48. COMMENT: Page 649 (Item b). We are aware of few if any erosion protection structures which have demonstrated success in controlling long-term beach erosion.
RESPONSE: Section 505.9(6) must be considered in conjunction with subsection (c) which requires a long-term maintenance program for their replacement as needed. Further, the State’s coastal area has a wide range of shoreline environments some of which are more responsive to structural solutions.
49. COMMENT: Page 650 (Item b) - It should be noted that the control of local bluff relief alone is not necessarily well correlated with the recession rate, and hence the setback requirements are rather arbitrary.
RESPONSE: These requirements are for moveable structures within the hazard area. The bluff set backs are correlated with recession rates but are designed to avoid new development on the portion of the bluff prone to sudden failure along slip planes.
50. COMMENT: Page 652 (Item 3) - Because of the deficiencies regarding the lack of an established methodology for determination of recession rates (as noted above on page 636), anyone with a newer, albeit inferior, data set could challenge hazard designations and tie up the appeals processes. What is the long term? What is the acceptability of data resources such as field surveys, maps or aerial photos?
RESPONSE: The 30 year setback is established in “The Shoreowner’s Protection Act.” The hazard designations are based on field surveys, maps and current and historical aerial photos. The sole acceptable basis for appeal of a recession rate is to show that it has been incorrectly calculated (Section 505.11). See also response No. 44.

G. NUCLEAR REGULATORY COMMISSION

Frank W. Young

State Relations Section

COMMENT: We find that the program, as far as the siting of energy facilities is concerned, has been structured on existing regulations and policy. We are familiar with these and have cooperated with New York on the review of proposed facilities. We, therefore, have no comment.

RESPONSE: No response necessary.

H. DEPARTMENT OF TRANSPORTATION

Richard F Walsh, Director
Office of Economics

1. COMMENT: Many of the policies, particularly #1, 7, 20 and 26 are sound and well developed.

RESPONSE: No response necessary.

2. COMMENT: Policy 14 (erosion protection structures) - By prohibiting the construction and reconstruction of these structures where there would be a measurable increase in erosion or flooding at or near the site, no recognition is given to the protection of existing investments in the area.

RESPONSE: Normal maintenance and repair of existing erosion protection structures does not require an erosion hazard area permit (see propose: Coastal Erosion Management regulations, Part 505, Appendix A). Existing, investments can be protected provided the methods chosen for protection, structural or nonstructural, meets the regulations, standards and criteria necessary to implement this policy; which are contained in the guidelines for the policy and in Appendix A. Note also that if the reconstruction essentially reproduces the old structure, there is less likelihood that it would cause a measurable increase in erosion.

3. COMMENT: Policy 22 (shoreline development and provisions for recreation) - Unfortunately, civilian recreational use of Coast Guard and other military facilities on a regular basis cannot be allowed due to safety and security problems.

RESPONSE: We agree; although for some locations, land areas not directly, or immediately needed by the facility could, with the permission and cooperation of the Coast Guard, be used periodically for recreation.

4. COMMENT: Policy 23 (historic resources) - The use of a 500 foot perimeter as a boundary of environmental impact seems arbitrary (pp. 232-33).

RESPONSE: A 500 foot perimeter is used because numerous New York State land use regulations use this figure in calling for review of adjacent uses (State parks, municipal boundaries, etc.)

5. COMMENT: Policy 28 (ice management practices) - The Coast Guard is unaware of any past adverse effects from its domestic icebreaking operations on electric power.
- RESPONSE: Past ice management activities by the Coast Guard may not have had adverse effects on the production of hydro-electric power. However, the intent of this policy is to require, for present and future activities, the assessment and prevention or mitigation of adverse impacts on fish and wildlife, the production of hydro-electric power, and shoreline erosion or flooding.
6. COMMENT: Policy 34 (discharge of waste material from vessels) - To prohibit discharge of sewage from all watercraft seems inconsistent with previous statements reflecting the desirability of providing less than secondary treatment for wastewater treatment plants discharging millions of gallons of sewage per day, while watercraft discharges are relatively insignificant.
- RESPONSE: Discharges are already being regulated by the State under Navigation Law (Section 33-C). The prohibition of vessel waste disposal at discrete locations (such as significant fish and wildlife habitats, recreational areas and water supply areas) should provide a very effective means of protecting these areas. The effect of these vessel wastes at these particular areas is by no means insignificant. On the other hand, recent scientific studies indicate that it is not always ecologically desirable to require secondary treatment of sewage being discharged into open marine environments where assimilative capacities are great and ambient nutrient levels are well below acceptable State standards.
7. COMMENT: Policy 35 (dredging and dredge spoil disposal) - No recognition is given to the difference in environmental and economic effects from maintenance versus new dredging, nor is there a discussion on what critical areas and impacts are most important to avoid and when.
- RESPONSE: Additional guidance necessary to determine consistency of an action with this policy has been added to the explanation of policy. Appropriate references have also been cited.
8. COMMENT: Policy 44 (wetlands) - It would be useful to list at least the basic standards for New York's four categories of wetland uses.
- RESPONSE: Standards for the four categories of wetland uses are provided in the regulations found on page 94 of Volume II.
9. COMMENT: Mitigation measures for wetland development should be discussed.
- RESPONSE: See Freshwater and Tidal Wetland regulations in Volume II, which include mitigation measures.
10. COMMENT: There is a need to include specific policies on coastal structures (bridges, submerged infrastructures, dams etc.).

RESPONSE: We disagree. The direct and significant impacts on the coastal area of activities involving coastal structures/construction are adequately addressed and considered in the comprehensive set of 44 policies described in Part II, Section 6.

11. COMMENT: There is a need to distinguish types of water bodies (rivers, lakes, ocean, etc.) and ecosystem/habitats (shellfish beds, finfish, migratory pathways, etc.) and to integrate these elements into a coherent set of policies.

RESPONSE: The policies described in Part II, Section 6, are applicable to the entire coastal area. Policy 7, the protection of significant fish and wildlife habitats, is the primary policy which addresses the protection of habitats. The variability in habitats that exists in rivers, lakes, wetlands and other types of sub-ecosystems is accommodated for in the new policy guidelines provided in Policy 7.

12. COMMENT: On page 104, paragraph 4 - the words “waters of the United States, including the territorial seas” should be substituted for “estuarine” in the discussion of marine sanitation device regulations (from 33 CFR 159.1).

RESPONSE: See revision.

13. COMMENT: Page 338, paragraph 5 - We recommend that the New York State Department of Environmental Conservation (DEC), rather than the Department of State, handle consistency reviews for bridge projects since all bridge permit actions require, at minimum, a water quality certificate issued by the DEC. Often wetland and construction permits are also required. This would make for better coordination between Federal agency applicant and State.

RESPONSE: Only one State agency may be designated as the sole reviewer of Federal consistency determinations (15 CFR 9/30.18). The Department of State’s mandate makes it most suitable for the variety of policies in the Program. DEC input to this decision will be important.

14. COMMENT: Page 339, paragraph 3 - All Coast Guard bridge permit actions require circulation of a public notice. New York’s requirement for public notice for license/permit consistency review would be combined with the Coast Guard’s process to minimize delays and paperwork.

RESPONSE: The suggestion is appreciated and contact will be made with the Coast Guard, following Federal approval, to examine the possibility of combining permits. Policy 6 on page II-6-31 calls for expediting permit procedures and Department of State gives this a high priority. The U.S. Coast Guard’s cooperation in this matter is welcome.

15. COMMENT: Page 343 of the document lists Coast Guard activity which the State of New York feels likely to require a consistency determination including:

- a. Location, placement or removal of navigation devices. Although generally stated, we assume this refers to short range aids, buoys, daymarks, radar towers, etc. This does not directly affect the coastal zone and should be deleted;

- b. Expansion, abandonment, and designation of anchorages. Anchorages are not licensed or permitted; they are designated by regulation;
- c. Expansion, abandonment and designation of lightering areas. Lightering areas are not licensed or permitted. This does not directly affect coastal zone and should be deleted;
- d. Expansion, abandonment, and designation of shipping lanes. Shipping areas are not licensed or permitted, they are designated by regulations. This does not directly affect the coastal zone and should be deleted.
- e. Expansion, abandonment, and designation of pilot areas. The Coast Guard does not establish pilot areas. The intent of this particular citation is unclear to us. Contact with personnel from the New York Department of State did not clarify this issue since they also were unsure as to its reference. This should be deleted.
- f. Ice management practices and activities. This does not directly affect the coastal zone and should be deleted.

RESPONSE: Regarding items a, c, d, and f, we disagree. These activities directly affect New York's coastal area and are subject to the Federal consistency provisions of the NYCMP. Regarding item e, pilot areas, this has been deleted. Regarding the comment that b, c, and d above are not licensed and permitted activities -- we agree. However, they are direct Federal activities and therefore should not be deleted from consistency review. They will be listed in the FEIS under Table 2, Section 1, Direct Federal Activities and Development Projects. Regarding item b, navigation devices, these activities have been revised and are now more narrowly defined. These revisions are intended to avoid unnecessary submissions consistency certifications.

- 16. COMMENT: Appendix D, addressing excluded Federal land on pages 737-739, requires a few corrections:
 - a. Bellport Station and St. George Base should be deleted (the Coast Guard no longer owns them);
 - b. Cape Vincent Light Station should be listed as containing 0.6 acres;
 - c. Carlton Island Light Station is now owned and maintained by the St. Lawrence Seaway Development Corporation. The complete reference to Carlton Island Station should be deleted;
 - d. The reference to Gallo Island listed with properties under license to the U.S. Coast Guard, Ninth Coast District, should be deleted;
 - e. The reference to the HF/FM Antenna Tower in Rochester listed with properties under license to the U.S. Coast Guard, Ninth Coast Guard District, should be deleted.

RESPONSE: Corrections have been made as suggested.

I. FEDERAL AVIATION ADMINISTRATION

Elliott Summer

1. COMMENT: Wording on page 337 suggests all FAA activities in the State would need a consistency determination.

RESPONSE: See changes in wording which inserts “located in or directly affecting the coastal zone.”

2. COMMENT: Page 482 recommends two landfill sites at Gateway National Recreation Area have their termination dates extended so that end-use site plans can be fully developed. These two sites present a serious bird hazard to aircraft operations into and out of JFK Airport. There is to develop the land use plans before the 1985 closure date.

RESPONSE: Current agreements call for the closure of these landfills by 12/31/85. New York City Department of Sanitation is exploring alternative means to waste disposal and is moving forward with the planning phases of two resource recovery facilities. These projects would help reduce the amount of waste currently being landfilled.

New York City Department of Sanitation is required through NYCRR, Part 340 to develop end-use plans for all landfills operated by the City. End-use plan for Foundation Avenue should begin shortly.

New York City has tried several tests of proposals designed to disburse the seagulls. Unfortunately, none of the procedures tested have been shown to be effective. New York City has always been responsive to any program the FAA is interested in pursuing to help ameliorate the seagull problem and will continue to fully cooperate.

SECTION 2 – RESPONSES TO STATE AND LOCAL WRITTEN COMMENTS ON THE DEIS

A. NEW YORK STATE DEPARTMENT OF TRANSPORTATION

W. C. Hennessy, Commissioner

1. COMMENT: For many of the Department of Transportation projects multiple consistency determinations will be necessary. This amount of effort seems excessive and redundant. This process is further complicated at the Federal level, for permit and funding actions are governed by different procedures and additional policies. Administrative efforts could be reduced if a “lead agency” was made responsible for the consistency determination which is based upon a single set of criteria.

RESPONSE: When two or more Federal agencies are involved in determining the consistency of a project with a state’s coastal management program, the agencies are encouraged, not required, to coordinate their reviews and develop a single consistency determination. If Federal agencies choose this approach, administrative efforts will be reduced. It is expected that the evaluation of a project involving Federal actions will be performed during the NEPA review process. Consistency determinations are made with a single set of criteria. Federal agencies utilize the policy statements, explanations and

guidelines in the program document. State agencies use the DOS Part 600, Section 600.5 regulations which contain the same criteria except for criteria which are a part of other existing State law already applicable to the actions of state agencies. There is not a “lead agency” for making consistency determinations (each Federal agency has the responsibility for determining the consistency of its proposed actions in the coastal area). However, the NYS DOS has been designated the State “lead agency” for review of consistency determinations.

2. COMMENT: The discussion of the Federal consistency process in the CMP/DEIS document does not identify a class of projects which have no significance and thus do not require a consistency determination. There are many Department of Transportation projects which are of small magnitude and have no significance to the objectives of coastal policies. Projects which are categorically excluded from NEPA should not be subject to the consistency process.

RESPONSE: Specific types of transportation projects and activities which are likely to affect New York State’s coastal area are subject to the Federal consistency process if identified in Table 2, pp. II-9-18 to 25 Federal agencies determine if a proposed project will affect the State’s coast. Federal regulations pertaining to this process do not provide for categorical exclusion such as those under NEPA. The State’s consistency process does exclude actions based on their significance. Actions which are considered “Type II” under SEQR are not subject to the state consistency procedure. Further, any actions which have been excluded from the SEQR provisions are excluded from the State agency consistency process.

3. COMMENT: The discussion on page 3 concerning the lack of coordination among State agencies is misleading. The SEQR process requires and has resulted in effective coordination among agencies. Attributing successful coordination to CMP is inaccurate.

RESPONSE: This discussion has been revised to reflect more accurately the coordination among state agencies.

4. COMMENT: The A-95 process is not working effectively and should not be used for federal consistency purposes. An alternative means of handling Federal consistency determination should be found. NEPA is an adequate mechanism for determining consistency.

RESPONSE: If the A-95 process is found to be ineffective, the Department of State will work with the Federal agencies to develop other means of notification for financial assistance activities. NEPA will be used, to the extent possible, for consistency purposes.

5. COMMENT: Staff training on the CMP and its requirements will be essential for the Department of Transportation.

RESPONSE: The Department of State will offer its assistance in such training endeavors.

6. COMMENT: The CMP/DEIS indicates that State agencies will be eligible for funding of their consistency review activities. The Department of Transportation has estimated that such activities will cost over \$50,000 per year.

RESPONSE: No response necessary.

7. COMMENT: The policy pertaining to the protection of cultural resources is not coordinated with and extends beyond numerous existing regulations. The policy does not allow for balancing impacts on historic resources with other social, economic and environmental consequences. Existing regulations achieve the policy's objective.

RESPONSE: Article 42 of the Executive Law contains a general policy that calls for the restoration and protection of historic and cultural resources. The resources enumerated in the guidelines are already covered by the existing programs, except for a designated local landmark within the boundary of an approved waterfront revitalization program. This is consistent with Article 42 which requires that local waterfront programs promote and preserve historic and cultural resources and re-use of existing building stock. The actions of state agencies are to be consistent with such programs to the maximum extent practicable. The guidelines under this policy are drawn from the U.S. Secretary of Interior's guidelines for the rehabilitation of historic buildings. Thus, this policy and its guidelines are coordinated with other existing regulations.

As to the issue of balance, this is provided for in SEQR (Part 617), and in DOS (Part 600) regulations. In both regulations, procedures are designed to achieve the balance between competing values.

8. COMMENT: In many instances, the landward boundary of the coastal area is a roadway or some other right-of-way (ROW). This is reasonable, but it subjects improvements requiring additional ROW to the consistency process. If this ROW land does not have any coastal significance, then minimal ROW acquisition should not significantly affect the coastal area. Some mechanism should possibly be provided to facilitate the implementation of minor ROW widening projects.

RESPONSE: In most instances, the shoreward side of an existing ROW is considered the landward boundary. Thus, widening projects which are landward of this boundary would be outside the coastal area. In certain locations throughout the State's coast, existing ROW's are close to the shoreline. In those instances, the entire ROW and/or a specified distance landward of the ROW is in the coastal area. If these minor widening projects are deemed a "Type II" for SEQR purposes, then they would not be subject to the state consistency process. Even if not Type II, the CAF addresses coastal issues expeditiously and if determined not to have a significant effect, the CAF could be used as a quick tool for consistency. If Federal funds are to be utilized on the project, then the appropriate Federal agency would determine if the project affects the State's coastal area.

9. COMMENT: A special study on the need for treating stormwater runoff from roads, parking lots, lawns and industrial sites should be conducted.

RESPONSE: The feasibility of such a study will be investigated.

10. COMMENT: The discussion on state alternatives is not sufficient. Estimates: of the amount and duration of program funding, the magnitude of administrative costs and project delays are not provided. The benefits of Federal consistency are discussed, but the possibility of achieving a similar degree of coordination through existing procedures is not examined.
- RESPONSE: The proposed state action alternative has been revised to include on the amount and duration of funding and costs to administer the CMP. Project delays are not anticipated, for the consistency processes - both state and Federal - are tied into or can be accommodated within existing review procedures. Under present Federal review procedures, Federal agencies are not required to uphold existing state policies or positions. Federal consistency requires Federal agencies to adhere to a state's coastal policies. In many instances the review procedures will be shortened as a result of the consistency procedures. This is significantly stronger than mere coordination.
11. COMMENT: Due to the limited availability of CMP funds, local governments should be informed of the level of financial assistance they could receive before developing local programs.
- RESPONSE: Refer to Part II, Section 4, pp. 11-4-18 to20 which discusses program funding, and Section 10, Part II.
12. COMMENT: The discussion on the Barge Canal (p. 66) should be deleted, because it does not accurately describe the operations of the canal, and with the exception of two terminal points is outside the coastal area.
- RESPONSE: The discussion on the Barge Canal has been deleted.
13. COMMENT: The term "Geographic Area of Particular Concern" should be deleted from the New York City program
- RESPONSE: The term has been deleted.
14. COMMENT: Changes to the New York State CMP and proposed regulations should be included in the FEIS.
- RESPONSE: Such changes are required to be incorporated. Refer to this document.

B. STATE OF NEW YORK METROPOLITAN TRANSPORTATION AUTHORITY

Mary P. Bass

1. COMMENT: The MTA objects to guidelines which in part define a reduction in the existing level of public access to recreation resources in terms of reductions in the level of public transportation service and/or increases in fares to the resources. MTA feels that results of such guidelines would lead to the establishment of an unfair and unfeasible policy of reduced fares and/or subsidized service for a special group of users.
- RESPONSE: The following modification has been made to this guideline to take into account MTA's need to make changes in service in order to satisfy system-wide objectives: "...use, and such reduction cannot be reasonably justified in terms of meeting system-wide

objectives.” In addition, with respect to increases in fares to the recreation resources, the underlined modification has been made to Subsection A(1)(d)(4) which should satisfy the concern about furthering differential fares, not now a policy: “There are substantial increases in the following: already existing special fares of public transportation to a public water-related recreation resource or facility;...”

2. COMMENT: MTA questions whether OCZM has the authority to adopt “guidelines” regarding mass transportation fares in the New York metropolitan region.

RESPONSE: The State of New York, not OCZM, is adopting the guidelines, since they are part of New York State’s Coastal Management Program being submitted to OCZM for Federal approval.

C. THE PORT AUTHORITY OF NEW YORK AND NEW JERSEY

Anthony Tozzoli, Director
Port Department

1. COMMENT: The discussion under Policy 3 in the New York City’s local program indicates that the development plans and activities of the Port Authority will be subject to review by the Secretary of State and the City Coastal Commission. This is interpreted to mean that such plans and activities will be subject to study and not a review and approval procedure. The latter would be contrary to the intent of the bi-state legislation and in violation of the compact creating the Authority.

RESPONSE: Article 42 requires all state agencies to be consistent with the coasts policies. It provides no distinction between types of State agencies. State agencies must also be consistent to the maximum extent practicable wit; an approved local waterfront revitalization program. As required by the DOS Part 600 regulations and amendments to DEC Part 617, these determinations of consistency would be made by the State agency. The Secretary of State has the authority to review, evaluate, and issue recommendations and opinions concerning programs and actions of state agencies which may have the potential to affect the policies and purposes of this article. In the event the Port Authority were determined to be exempt from review by virtue of its bi-state legislation, it will be required to conform to the state program to the extent permissible under Section 307(e) of the CZMA.

2. COMMENT: Since the stated purpose of Policy 3 for the NYC WRP as explained on page 452 of the DEIS is to “ensure effective interface...”, the following modification to the language of the explanation is suggested: “...to ensure effective interface between the Port Authority and State and local waterfront revitalization programs, the Secretary of State and City Coastal Commission will consult with the Port Authority in the development and implementation of the Port Authority’s development plans and activities within coastal boundaries.”

RESPONSE: The principal objective of Policy 3, as stated on page II-6-17 of the FEIS, and as elaborated on page 74 of Appendix G is “...to focus efforts on direct and positive actions to support the major port agencies, the New York City Department of Ports and

Terminals and the Port Authority of New York and New Jersey, in order to promote their continued and increased vitality.” To assure that this policy is achieved within the New York City coastal areas, the City Coastal Commission and the Secretary of State will consult with the Port Authority of New York and New Jersey, the Department of Ports and Terminals, and other affected interests early in the development and implementation of pertinent plans and activities. The Port Authority would determine the consistency of their proposed actions with the approved programs. Refer to the above response.

3. COMMENT: With regard to Policies 19 and 20, the merits of public access to the waterfront are recognized, and the consideration of safety which is cited in the CMP/DEIS is strongly supported. However, consideration must also be given to cost, insurance, liability and available space. Similar consideration should be incorporated under Policies 24 and 25 (Scenic Resources) so that the construction, operation and maintenance of essential port facilities are not constrained.

RESPONSE: Under both access policies, safety and cost considerations are to be factored into decisions affecting the provision of increased public access. The cost consideration would include the concerns for insurance, liability and space. Also, the provision of access would not be required until some public agency or private association assumes responsibility for maintenance and liability. As for the policy pertaining to significant scenic resources, port operations and construction that impair such resources would be inconsistent with this resource protection policy. However, it is possible that essential port facilities could be constructed elsewhere along the coast. Policy 25 suggests that consideration be given to protecting the scenic quality of the coastal area. Generally, this can be accomplished through proper siting of structures, screening and other efforts which would not constrain existing and future port activities.

D. NEW YORK STATE DEPARTMENT OF PUBLIC SERVICE

Robert D. Vessels, Director
Office of Environmental Planning

1. COMMENT: Access roads are maintained in connection with transmission rights-of-way (ROW). By working closely with involved utilities, these roads could also provide a means for implementing Policy 20.

RESPONSE: Agreed

2. COMMENT: The Public Service Commission’s (PSC) policy relating to recreational development of transmission ROW is decided on a case by case basis rather than being an automatic part of every order issued. However, joint funding of recreational development for ROW’s has been stopped until research on the health and safety effects associated with such ROW’s is concluded.

RESPONSE: The discussion under Policy 22 B.3. has been revised accordingly.

3. COMMENT: In the DEIS Section 7.2.a.ii.1 (p. 303), it is not clear that an application for transmission facilities is made to the New York State Department of Public Service

while an application for steam electric generating facilities is made to the New York State Board on Electric Generating Siting and Environment.

RESPONSE: This clarification has been made.

4. COMMENT: The siting procedures in Article VII of the Public Service Law, discussed under Policy 27 of the New York City Program, relate to major electric and gas transmission facilities and do not apply to underground facilities located in cities with a population in excess of 125,000. Since new transmission facilities in the City of New York are likely to be located underground, their siting would not be reviewed pursuant to Article VII. Such facilities would, depending on location, be subject to a variety of State permit programs, including water quality and wetlands programs.

RESPONSE: This information is now reflected under New York City Policy 27.

E. NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Louis M. Concra, Jr., Director

Division of Regulatory Affairs

1. COMMENT: The proposed filing requirement, with regard to “Unlisted” actions in the coastal area, is burdensome and unnecessary. The volume of activities affected by this requirement is potentially high. “Unlisted” actions receiving a negative declaration should be excluded from the procedural requirements of Part 600 regulations.

RESPONSE: Article 42 of the Executive Law does not qualify which of the direct actions taken by State agencies should be subject to the consistency requirements contained in Section 919(1). In the development of the proposed Part 600 regulations, it was determined that “Type II” actions would not likely affect the achievement of the Article 42 policies. “Unlisted” actions, however, cover a wide range of activities which, even if they have no significant effect upon the environment, could either assist in or impede the achievement of coastal policies. The exclusion of this group of “Unlisted” actions would affect the capability of the Secretary of State to administer the State’s coastal program.

2. COMMENT: The proposed Part 600 regulations should reflect the streamlining of regulatory requirements for insignificant “Unlisted” actions.

RESPONSE: Streamlining existing and future State and other agencies regulations is one of the objectives of the CMP as well as the Office of Business Permits. This objective was, in part, achieved by incorporating the consistency requirements of Article 42 into the Part 617 SEQR regulations. In order to properly administer Article 42, however, additional procedures are necessary to ensure that State agency actions which do not have any significant effect upon the environment are being under-taken consistent with the coastal policies.

3. COMMENT: It should be made clear that the policies contained in an approved local waterfront revitalization program are not determinative on the matter of license issuance.

Also, these policies are not to be substituted for specific standards and criteria contained in laws and regulations of State resource protection programs.

RESPONSE: If a proposed State permit action is inconsistent with the policies of an approved local program, then that permit cannot be issued unless conditions are imposed on the permit which would result in the action being consistent with the policies. At no time, however, can a State agency issue a permit unless the proposed action complies with existing State standards and criteria. This requirement is found in Section 915(8) of Article 42 and Section 600.3(5) of DOS regulations.

4. COMMENT: On page 20 there is a mistake in the oil spill estimate for the North Atlantic field operations.

RESPONSE: This mistake has been corrected and the probability percent updated in accordance with U.S. Department of Interior information.

5. COMMENT: All bays and wetlands along Lake Ontario, and not just Braddock Bay, support bass and perch populations.

RESPONSE: The text has been modified accordingly.

6. COMMENT: The intent of the maps on pp. 38-42 is unclear. Maps of the boundaries and Federal lands would be more helpful.

RESPONSE: As indicated on page II-3-5 of the document, the purpose of the maps on pp. II-3-8 to 12 was to illustrate how some of the boundary criteria were applied in various areas of the State. Maps of the State's Coastal Area, showing boundaries and excluded Federal lands, were officially filed with state agencies in December, 1981. Inclusion of those maps in the CMP DEIS would have added considerable bulk to an already voluminous document.

7. COMMENT: The discussion on development in the section on coastal issues does not reflect comments previously submitted by DEC on infrastructure revitalization needs.

RESPONSE: The need to rehabilitate water and sewerage facilities is only part of the total need to revitalize and restore the State's deteriorating and underutilized waterfronts. In the guidelines on Policy 5, recognition is given to the need for rehabilitating essential public facilities and services. Also, the conditions of these vital facilities are currently under study by the State Legislature. The results of that study may be incorporated into the CMP upon its conclusion and acceptance by the Legislature and Governor.

8. COMMENT: It was DEC's understanding that a separate policy statement on winter navigation would be included in the CMP DEIS.

RESPONSE: The Coastal Management Program does not contain separate policies on any given activity which may or may not be proposed. The Program policies have been developed and are intended to be used as criteria by agencies when making decisions on the appropriateness of any given proposed action. The policies address the potential effects on the coastal area of any proposed action. Incorporating a separate policy for winter

navigation would set the stage for incorporating separate policies for each new major activity as it is being proposed. Over time this would result in an even lengthier, and ultimately outdated and useless document. The specific concerns which have been raised by DEC in regard to winter navigation are addressed in the State policies.

9. COMMENT: On page 73 the sentence should be changed to indicate that beaches are the most valuable coastal landform.
RESPONSE: Change has been made.
10. COMMENT: Changes should be made to sentences pertaining to damages caused by storms.
RESPONSE: Suggested changes have been made.
11. COMMENT: The issue discussion and policy on new energy sources should emphasize that Article 23 of the ECL prohibits production of liquid hydrocarbons in Lake Erie.
RESPONSE: The description of Article 23 under Policy 29 has been revised to reflect this prohibition.
12. COMMENT: The DEIS gives the impression that DEC has decided to proceed with the natural gas leasing program for the lands under Lake Erie. This decision has not been made.
RESPONSE: The explanation under Policy 29 has been revised accordingly.
13. COMMENT: On page 266 the reference to the Public Service Commission on the discussion on Article 23, Section 23-0305 of the ECL is incorrect.
RESPONSE: This reference has been deleted.
14. COMMENT: Comments previously submitted by DEC on the water resources issues section suggested that water quality as well as other water resources concerns should be discussed.
RESPONSE: The water resources section has been expanded to include a discussion on water supply and drought conditions. Other water resource related concerns raised by DEC are discussed under the flooding and erosion issues section.
15. COMMENT: The DEIS should contain more detail relative to the surveillance cleanup program for oil and other hazardous substance spills which is discussed on page 11-5-46.
RESPONSE: There is considerable discussion of New York State's existing programs on this subject under Policies 18 and 36. Further information is provided in Appendix F. Volume 2. The comment on page 11-5-46 suggests, however, that possibly more could be done under the current authority of State agencies. Through the Coastal Energy Impact Program, the Department of State has funded the preparation of oil spill prevention programs for the eastern end of Lake Ontario and the St. Lawrence River. Similar programs were also developed for all the inlet areas along the southern coast of Long Island. These plans should supplement current State agencies' efforts.

16. COMMENT: The policy on water-dependent uses should be more specific as to how the siting of such uses is determined.

RESPONSE: As stated in the explanation of that policy such uses are to be sited appropriate locations along the waterfront. Guidelines are provided to assist decision-makers in determining the type of use and the actual site. The decision to approve an action rests with the appropriate State agency subject to the consistency requirements of Article 42, Section 919(1). This process is explained further under Policy 2 and in Section 4 of the DEIS.

17. COMMENT: The statement on page 123 that the mining of sand and gravel is a water dependent use that should be facilitated in the coastal area is not consistent with Part 505 of the proposed erosion regulations which would limit this activity in coastal erosion hazard areas.

RESPONSE: This policy applies generally throughout New York State's coast. An activity, use, etc. is specifically prohibited or otherwise limited by existing State law and regulations, that activity cannot take place or, if applicable, must be modified to meet the State's requirements. This condition is contained in Article 42, Section 919(1) and in DOS Part 600 regulations. Therefore, the inconsistency cited does not exist, and the erosion regulations will limit excavation in coastal erosion hazard areas.

18. COMMENT: Several minor wording changes should be made to the explanation of Policy 11 and the discussions on various State means to implement the policy.

RESPONSE: The suggested wording changes have been made.

19. COMMENT: Statement on page 178 Section B.3 is incorrect. State becomes involved only when local regulation is not accomplished.

RESPONSE: The discussion under this section references another section under Policy 11 where this distinction is clearly made. No change is necessary.

20. COMMENT: The discussions under Policy 27 and in the energy planning process section do not address the federal OCS oil and gas leasing activities, nor the State's policies in reviewing them.

RESPONSE: Policy 29 specifically addressed Federal OCS oil and gas leasing activities. The text in the energy planning process has been modified to take into account such activities.

21. COMMENT: The Federal consistency procedures applicable to OCS gas and oil activities do not reflect the Department of Environmental Conservation's major role in this subject area. DEC is the State's lead agency for OCS matters, and it was understood that the Department would coordinate all OCS reviews.

RESPONSE: Federal regulations, pertaining to the consistency of Federal agencies' actions with a State's coastal management program, require that the State designate one agency which would be responsible for coordinating the review procedure in the State and rendering the consistency determinations. This requirement prevents the sharing of that

lead responsibility. As a result the Department of State must, as the designated agency, make such determinations. However, the Department is fully aware of DEC's role and responsibility on OCS matters and will consult with DEC on all OCS matters which are subject to a consistency determination. The discussion on this subject in the CMP DEIS has been modified to reflect this consultation process.

22. COMMENT: The CMP DEIS should identify the method for integrating implementing regulations with the NEPA process.

RESPONSE: The U.S. Department of Commerce consistency regulations urge Federal agencies to utilize the NEPA review process, whenever possible, to satisfy their obligations under these regulations. The CMP DEIS reinforced this recommended approach, for many documents produced under NEPA requirements will be used by the Department of State in concurring or objecting to the consistency determination of a Federal action affecting New York State's coastal area.

23. COMMENT: There is a need to identify and address the impacts of the coastal management program on individual projects approved through DEC's Construction Grants Program.

RESPONSE: Once the State CMP is approved, these projects must be consistent with the coastal policies.

F. VILLAGE OF MAMARONECK

Joseph P. Fraioli, Village Manager
Mamaroneck, New York

1. COMMENT: The Village of Mamaroneck states that it has created a permanent Coastal Zone Management Committee and urges Federal approval of the N.Y.S. Coastal Management Program so that the Village can complete preparation of, and implement a local Coastal Zone Management Program.

RESPONSE: Thank you for your support. No further response needed.

G. COLUMBIA COUNTY PLANNING DEPARTMENT

Edith A. Mesik, Planning Director
Hudson, New York

1. COMMENT: The Columbia County Planning Department states that the New York 3Uroastal Management Program would have many positive benefits for Columbia County, that the program goals are comprehensive, balanced and realistic, and that the program will protect and enhance the role of local communities in meeting coastal program goals through the preparation of a local waterfront revitalization plan. The Department recommends favorable review and approval of the program by the Office of Coastal Zone Management.

RESPONSE: Thank you for your support. No further response needed.

H. SCENIC HUDSON, INC.

Frances F. Dunwell
Poughkeepsie, New York

1. COMMENT: The erosion policies contained in Section 600.5 of the Department of State's regulations, which advocate the use of non-structural measures to mitigate property damages resulting from erosion, are not appropriate for the Hudson River shoreline. Recreational and other activities along the River require structural protection for erosion caused by ice and the wakes of passing ships. The policies are more appropriate for the Great Lakes and marine coasts. The prohibition for using public funds in the construction of such protective structures will eliminate the provision of access areas and boating activities.

RESPONSE: The erosion policies referred to in Section 600.5 do not preclude the use and construction of protective structures in any portion of New York State's coastal area. The use of public funds is indeed limited, but it does not prevent structural approaches, specifically in instances where human life, new water dependent uses and existing development would be protected. Therefore, the erosion policies are appropriate for all of New York's coastal area, including the conditions which prevail along the Hudson River shoreline.

I. SIERRA CLUB - ATLANTIC CHAPTER

Samuel H. Sage
Executive Director

1. COMMENT: The Department of State is not a natural resources protection agency and has no programmatic interest in the CMP. The Department of Environmental Conservation should be the lead agency or possibly a new, independent agency patterned after the Adirondack Park Agency.

RESPONSE: Refer to the Response to Comment III, E, 12.

2. COMMENT: The Sierra Club is disappointed by the proposed Program and views as a veiled raid on the Federal treasury coming up with a barely acceptable program at the last hour in order to qualify for Federal funds. Federal approval should be granted since it will provide for some limited interagency coordination and planning for coastal resources.

RESPONSE: No response required.

3. COMMENT: The underlying weak legislation behind this program can be strengthened by the yet to be elected Legislature in 1983. The Sierra Club hopes that Federal approval will be contingent upon a good faith effort towards such amendments.

RESPONSE: Federal approval is based on the adequacy of existing enforce-able State authorities.

4. COMMENT: There has been almost no public participation and the Program document contains no recommendations that lead us to believe that the situation will get any better.

RESPONSE: Since 1975, when the State first began to prepare the CMP, over 1,000 meetings have been held by Department of State staff with local elected officials, environmental and development interests, civic groups, and others displaying an interest in providing positive and useful advice and the facts to be incorporated in the Program. In addition, the League of Women Voters, through its Speakers Bureau, conducted numerous meetings concerning this program throughout the State.

Three series of formal public hearings have been held in as many years. One series was conducted by the State Legislature. Two series of informal public meetings have also been held throughout the State, the last being conducted in May/June, 19E2. The Department of State has also utilized the advice provided by the State Coastal Management Citizens Advisory Committee, formed in 1977. Many ad hoc advisory committees have also provided valuable information used in this program.

For the future, each local government desiring to prepare a waterfront revitalization program will be required to demonstrate it has reached a consensus as to the future of its waterfront, among the users, regulators, and those affected by the activities occurring in the coastal area. This will obviously require extensive public involvement.

5. COMMENT: The coastal boundary is inadequate and non-uniform, thus limiting protection of shorelines. The boundary should be set with objective natural resources criteria and not be based on administrative convenience.

RESPONSE: The coastal boundary was delineated based on criteria which included natural resource considerations among others. The following criteria were used: (1) utilize a one-tier boundary; (2) conform with the nearest cultural feature or political boundary; (3) include all land and water uses directly impacting coastal waters; (4) include any specially designated management areas; (5) include tidal and saline waters, wetlands, islands and beaches; (6) exclude present federally controlled lands; (7) provide buffer areas, where appropriate; (8) coordinate boundary lines with those of adjacent states; and (9) incorporate, to the greatest extent possible, local agency recommendations. In addition, the following special concerns, which include natural resource considerations, were recognized in the final landward boundary delineation: agricultural lands; viewsheds; power plant sites; historic sites; industrial areas; 100 year flood line; and coastal recreation areas.

Administrative convenience in establishing a coastal boundary is a Program requirement (15 CFR 923.31), i.e. the coastal boundary should be clear and exact enough to permit determination of whether property or an activity is located within the boundary.

6. COMMENT: The inadequate number and protection of GAPCs has been made moot by their elimination from the Program. Provision must be made for protecting critical resource areas and the Program does little in this regard.

RESPONSE: Special Management Areas (SMAs) is the term used in the CMP, not Geographic Areas of Particular Concern (GAPCs). Refer to PART II, Section 8 for a thorough discussion of the Program's Special Management Areas. Substantial provision is made for the protection of critical resource areas throughout the coastal areas. Refer to Policies 4, 7, 8, 12, 23, 24, 26, 27, 28, 31, 32, 33, 40, 41, 42, 43, 44.

7. COMMENT: The proposed amendments to SEQR regulations will not require adequate consideration of impacts of proposed projects on the coastal zone.

RESPONSE: In addition to the considerations required to be analyzed in SEQR as it stands without the proposed amendments, the proposed amendments will require consideration of all the coastal policies listed in the proposed NYCRR, Title 19, Part 600, Section 600.5.

8. COMMENT: The regulations should not be limited to actions by State agencies.

RESPONSE: Refer to the Response to Comment III, C, 1.

9. COMMENT: SEQR requires review and coordination and is not a regulatory cut with findings that are binding on anyone.

RESPONSE: SEQR not only requires full disclosure of environmental impacts but also requires written findings that (a) the action to be taken is the one among the reasonable alternatives which minimizes or avoids adverse environmental efforts to the maximum extent practicable, and (b) to the maximum extent practicable minimizes and avoids those adverse environmental efforts revealed in the EIS. In addition, the amendments proposed for SEQR (617.9(c)(3)) will require consistency with the Part 600, Section 600.5 coastal policies.

The findings just referred to have been interpreted as providing authority for agencies to condition or deny permits in order to address factors disclosed in an EIS. *Miracle Mile Associates, v. DEC*, 430 F. Supp. 2nd 440, July 10, 1980. Those factors will not include the coastal policies. See amendments to Part 617, Section 617.14(f)(10).

J. HUDSON RIVER SLOOP CLEARWATER, INC.

Sarah L. Johnston

1. COMMENT: Clearwater has been involved for over a decade in extensive public environmental education and Hudson Riverfront recreation activities. The Clearwater has helped set up a fishery resources management program for the Hudson, and has been involved with dredging issues, pesticide problems and water quality standards. The Clearwater strongly endorses and supports implementation of a coastal program for New York State.

RESPONSE: Thank you for your support.

2. COMMENT: The CMP regulatory framework lacks a system for determining priorities among the forty-four coastal policies as well as any method for weighing the costs to

coastal resources vs. the benefits of a particular project. Some system of conflict resolution should be included.

RESPONSE: Refer to the Response to Comment III, K, 5.

3. COMMENT: Regulations requiring State agencies to fill out coastal assessment forms (CAF) should be expanded to include a required notification process of a proposed action.

RESPONSE: A required notification process for proposed actions is provided for in every instance where any one of the questions on a CAF is answered “yes”. DOS Part 600, Section 600.4 requires that a copy of that CAF, with a brief and precise description of the nature and extent of the actions, be forwarded to the Secretary of State.

4. COMMENT: The regulations which set forth requirements for certification of a project [19 NYCRR Part 600.4(2)(3)] should be changed to allow certification of a non-significant environmental impact only if more than one coastal policy is to be advanced (rather than conformance with only one policy).

RESPONSE: The necessity to advance one or more of the coastal policies is on y part of the requirements for certification. Before undertaking an action, the State agency must certify that the proposed action will not substantially hinder the achievement of any (emphasis added) of the coastal policies and (emphasis added) advance one or more of such policies. Further, if the action will substantially hinder the achievement of any policy, four additional requirements must be met.

K. SIERRA CLUB

Bryan Luftglass

Westchester-Putnam Group

1. COMMENT: In Section 2 “Coastal Regions of New York” there is no mention or coverage of Westchester County’s Long Island Sound Coastline.

RESPONSE: Although that subregion is not specifically discussed in Section 2, the coastal issues and circumstances of this area were a determinant of the final program. The report “Hudson Valley Regional Element”, including Westchester County’s Long Island Sound Coastline, contains a discussion of the coastal issues of this area and was a major contribution to the final program.

2. COMMENT: It is imperative that as much coastal property as possible as rapidly as possible be set aside to preserve unique environments.

RESPONSE: The Coastal Management Program recognizes the importance of pre-serving unique environments. Federal funds which may be allocated to the program may not be used for such acquisition. The CMP will actively seek programming of other funds to preserve such areas. Current DOS participation on the Hudson River Estuarine Sanctuary Program reflects such an effort.

3. COMMENT: The Agricultural runoff of pesticides as a source of toxic Pollutants should be noted in the issue discussion on fish and wildlife.

RESPONSE: Agree, the text will be revised.

4. COMMENT: While the discovery of oil under Lake Erie is unlikely, the potential for longer term damage from condensates associated with natural gas should be investigated.

RESPONSE: Article 23 of the NYS Environmental Conservation Law prohibits production of liquid hydrocarbons in Lake Erie either alone or in association with natural gas. Therefore, any wells encountering appreciable amounts of oil on natural gas condensate must be plugged and abandoned immediately.

5. COMMENT: While the tidal range in the Great Lakes-St. Lawrence area may be relatively small, these bodies of water are subject to tidal movements.

RESPONSE: The mean range of true tides on the Great Lakes is .03 meters. This is relatively small.

6. COMMENT: On page 23 it is mentioned that “14,130 cubic feet of debris enter the Hudson River annually”. Do these statements imply that the difference (585,870 cubic feet) enters the Harbor annually, or are these statements inconsistent?

RESPONSE: It is estimated that 600,000 cubic feet enters the New York Harbor annually.

L. UNITED MOBILE SPORTSFISHERMEN, INC.

William E. Miller

1. COMMENT: Maps showing coastal boundaries should have been provided with the DEIS.

RESPONSE: Maps showing the statewide coastal boundary for each coastal county, city, town, and village have been filed with the clerk of each jurisdiction and are available for inspection. The cost of printing and including a coastal boundary map with the DEIS would have been prohibitive.

2. COMMENT: Spawning and nursery areas in the Hudson River for striped bass, in Long Island’s Great South Bay for weakfish, and in other areas for important species should be shown on the coastal area map.

RESPONSE: Where these spawning and nursery areas meet the criteria for the identification as “significant fish and wildlife habitats”, which should be the case in most of the above-cited instances, they will be shown on the coastal area map and a narrative prepared detailing information on that particular habitat.

3. COMMENT: Policy 9 for recreational use of fish and wildlife resources seems too oriented to freshwater and cities. It may need to be supplemented to cover saltwater access.

RESPONSE: There was no intention to exclude or diminish the importance of recreational fishing in the marine waters of the coast. To emphasize its equal importance, a phrase to the effect has been added to the explanation of the policy.

4. COMMENT: Policy 19, dealing with public access to public water-related resources and facilities, may discriminate against suburban and non-urban areas because of guideline

A(4) dealing with State agency plans and pro-grams for increasing public access and their priorities for particular areas.

RESPONSE: In developing the State CMP, the DOS discovered that the most severe access deficiencies occur in urban areas. The guidelines for implementing the access policy recognize this situation by emphasizing the need to give a higher priority for access projects in urban areas at the present time. Over time, as projects are completed to increase access in urban areas, the priority can change.

5. COMMENT: Existing ORU access routes in the coastal zone to the beach and along the beach should be mapped in order that they are recognized and protected.

RESPONSE: In the first year of the “306” CMP, all existing coastal public access will be located, mapped, and described in terms of mode, capacity, and condition. This will be the basis for a second year analytical phase to determine where and what kinds of increased access are desirable.

6. COMMENT: Policy 21, dealing with water dependent and water enhanced recreation, should specify that, all other things being equal, water dependent should be favored over water enhanced recreation.

RESPONSE: Agreed. A sentence will be added in the explanation of the policy to reflect this change.

7. COMMENT: With respect to utility transmission facility siting, it is suggested that recreational vehicle trail use (for trail bikes, 4-wheel drive vehicles, and snowmobiles) also be considered a suitable recreational activity.

RESPONSE: Agreed.

8. COMMENT: In Section 600.2 of the Draft DOS Part 600 regulations, the definition of “Actions” is too narrow by including only SEQR Type I or unlisted actions.

RESPONSE: The definition of “Actions” was developed in response to the need both to keep the burden of review on State agencies at a reasonable level and at the same time ensure that all significant actions are covered. The DOS believes that the current definition meets both requirements.

NOTE: The following comments address the Draft Part 500 Regulations

9. COMMENT: Where non-movable structures are to be placed in a structural erosion hazard area, Section 505.7(b) would require construction of erosion protection structures which can act as a barrier to lateral access along the shore. This Section should be deleted because this requirement will adversely affect CMP access objectives (in spite of regulations against such effects). Only setback requirements should be applied and, in our view, structure loss is preferable to public access loss. Section 505.7(b) should be deleted.

RESPONSE: The Part 505 Regulations are derived from the “Shoreowner’s Protection Act”, Article 34, ECL, which deals solely with erosion hazards. The Act sets rigorous standards for the use of erosion protection structures including: a requirement that there

will be no measurable increase in erosion to the site or at other locations; and that adverse effects to natural protective features and natural resources must be minimized.

10. COMMENT: Section 505.8(c)(7) requiring vehicle travel seaward of the upper Fieb7" isline or, when absent, the toe of the dune, and for no travel on vegetation, are all proper and supported.

RESPONSE: No response required.

11. COMMENT: Section 505.8(c)(8) is highly irregular and is condemned. Local governments always have the authority to regulate uses and do not need DEC permission. This program reveals a bias against our use that is not similarly shown for other inherently more destructive uses and thus selectively waives application of standards in only this particular instance. It is vehemently rejected and DOS and OCZM are urged to require its deletion.

RESPONSE: Provision deleted.

12. COMMENT: Again, a selective bias against motor vehicles is evident in Section 505.6(c)(9) which states that "Nothing in this Part authorizes trespass of motor vehicles on private lands". Does this mean that trespass by hikers, walkers and boaters is authorized? All trespass is covered under existing law regardless of mode, and is a ridiculous provision on its face and should be deleted.

RESPONSE: Provision deleted.

13. COMMENT: Section 505.8(d)(2) - prohibition of vehicular traffic on bluff faces is proper and supported.

RESPONSE: No response necessary.

14. COMMENT: Permit requirements for pedestrian dune crossings will-inhibit their use, and is regulatory overkill. Elevated walkways/stairways may not be the only viable technique. There is always the alternate option of periodically restoring the dune elevation.

RESPONSE: Ill-planned and poorly constructed pedestrian walkways and stairways can cause substantial damage to the fragile primary dunes, interfere with their dynamics and thus reduce their natural protective character which is recognized in "The Shoreowner's Protection Act." The Department of Environmental Conservation hopes that the permit requirement will be a benefit to applicants by providing technical assistance on the proper construction and design of such walkways.

15. COMMENT: Section 505.7(b) does not address the fact that erosion protection structures frequently impair public access to or along the coast. Bulk-heading and backfilling with fill taken from the water side of the bulkhead often results in public movement along the shore being blocked by private property on the landward side of the bulkhead and by water on the waterside. At a minimum, mandatory public easements across such property should be required as a condition for permit approval, with appropriate structure design to permit such movement.

RESPONSE: See also the Response to Comment 9 above. "The Shoreowner's Protection Act" contains no provisions for such conditioning of permits in erosion hazard areas.

However, see particularly CMP policies 9, 19 and 20 regarding public access to coastal resources. The inclusion of public access over such structures is encouraged.

16. COMMENT: Section 505.8(e)(5) - the prohibition of vehicular traffic on primary dunes is supported in concept but it should be modified to prohibit traffic dunes “except across designated vehicular dune crossings” to allow access and egress from the beach.

RESPONSE: See revision, suggestion incorporated.

M. FRIENDS OF ROCKAWAY, INC.

Bernard J. Blum

- 1 COMMENT: There is general dissatisfaction with the manner by which the Bay/Rockaway area has been treated by the New York City Planning Commission’s CMP. Numerous detailed deficiencies are cited. A principal recommendation is made to the establishment of a Task Force made up of representatives of the community and agencies with jurisdiction in the area. The Task Force would be responsible for setting goals for economic and recreational development conservation, and erosion control.

RESPONSE: The NYC WRP deals with procedures to be utilized to manage the NYC coastal area. Specific projects for particular areas of the City, such as the Jamaica Bay/Rockaway area, will receive special attention upon implementation of the WRP. Public participation in these activities will be achieved through the community board, and other mechanisms as appropriate.

- 2 COMMENT: There is no policy for preventing environmental degradation by private interests in the form of excessive rates of erosion.

RESPONSE: Policies 13 and 14 are focused on preventing the construction or reconstruction of erosion protection structures if they adversely affect adjacent shorelines. New York City policies E and G add specificity to these policies and apply to both public and private actions. In addition, the Department of City Planning will be developing an erosion hazard area ordinance which will be in conformance with the State’s Environmental Conservation Law, Article 34. This law provides for minimum standards and criteria to regulate activities and developments, including the placement of erosion protection structures so there will be no measurable increase in erosion to the development site or elsewhere.

3. COMMENT: Numerous structural solutions are presented for erosion and marine life problems occurring along the Rockaway beaches.

RESPONSE: It is not feasible to comment here on the validity of proposed structural solutions to specific erosion on marine life problems. Any proposals, of course, must be consistent with the policies of the approved NYC WRP and must be in accord with New York City’s erosion hazard area ordinance, when approved.

4. COMMENT: The Arverne-Edgemere Urban Renewal Area is a violation of state revitalization and access policies.

RESPONSE: Though this specific project may not be consistent with the coastal policies, the NYS CMP and NYC WRP are, not approved. Once approved, all proposed actions in the coastal area must be consistent with coastal policies.

N. COMMUNITY BOARD NO. 18

Frank R. Seddio, District Manager
Brooklyn, New York

1. COMMENT: Community Board No. 18 requests a special management area for the hydrological areas of Jamaica Bay which would upgrade the environmental quality of the Bay and preserve the unique characteristics and relate to the upgrading of the water quality.

RESPONSE: The New York City WRP includes the periphery of Jamaica Bay within its boundary. However, Jamaica Bay, itself, is a federally owned property and is part of the Gateway N.R.A. As such, it is excluded from the State's, and thus, the City's coastal area. The management of this water body is the responsibility of the National Park Service.

2. COMMENT: The Board requests pollution control in Paerdegat Basin.

RESPONSE: The New York City proposed waterfront revitalization program contains several policies dealing with water quality and describes what steps the City will take to coordinate water pollution control activities with protection of natural coastal resources. The City's program supports the implementation of a Paerdegat Basin tributary study which is designed to address the specific problems of the basin.

2. COMMENT: Illegal dumping is a problem. The Board would support a solid waste policy which would remove solid waste pollution and illegal dumping and which would have prevention and enforcement provisions.

RESPONSE: The proposed New York City WRP contains measures and city means for implementation of policies on solid waste dumping (cf. NYC policies J and K).

O. GROUP FOR THE SOUTH FORK, INC.

Nancy Nagle Kelly, Planner

1. COMMENT: Group for the South Fork Inc. commends the efforts of the State to date in developing a comprehensive management program for coastal land and water use activities. While some aspects of the plan need further work and clarification, the framework has been laid for an effective program.

RESPONSE: Thank you for your support. No further response needed.

NOTE: The following comments refer to the draft DEC Part 500 regulations on the Coastal Erosion Hazard Areas Program.

2. COMMENT: Section 505.7(b) seems to promote the use of erosion control structures. A great deal of evidence exists that so-called erosion protection devices are frequently improperly placed, do not serve their intended purpose, and that groins in particular area

of limited are unknown value in preventative erosion and hurricane damage and cause scouring of the beach front thus increasing erosion.

RESPONSE: The intent of the regulations is not to promote structural protection. Such protection could only be built if the requirements of Section 505.9 were met. However, the prominent placement of Section 505.7(b) before the requirements for movable structures contained in Section 505.7(c) may create the impression of preference. To avoid this final regulations will have the order of the two reversed. Note also that the introduction to 505.9 restates the findings of “The Shoreowner’s Protection Act” regarding the problems associated with the use of structural protection measures.

3. COMMENT: In its report, A Coastal Erosion Subplan for Nassau and Suffolk Counties, the Long Island Regional Planning Board states that coastal IT-HMV-plans should be designed to promote “the continuation of natural geomorphic processes responsible for the maintenance of coastal landforms.” The report emphasizes non-structural solutions to erosion control problems and discourages projects that block the transport of sand.

RESPONSE: The cited report (which was prepared for the NYS Department of State and financially aided by the Federal Office of Coastal Zone Management) was used extensively in the development of the Coastal Management Program and in drafting the “The Shoreowner’s Protection Act”. However, in passing the Act, the State Legislature elected to allow greater discretion to property owners in choosing among the array of alternatives available, for the appropriate method to deal with erosion hazards. Nevertheless, as noted in the response above, the Legislature also prescribed rigorous standards where structural measures are employed. You should also be cognizant of the Coastal Management Program Policy 17 which requires the use of non-structural measures whenever possible.

4. COMMENT: Section 505.8(c)(5) exempts the construction, modification, or restoration of structures less than a certain size and/or of a temporary nature. This may prove detrimental in certain sensitive beach areas.

RESPONSE: Provision deleted.

5. COMMENT: The protection of barrier islands, spits, and bay barriers would be greatly aided by the Federal Barrier Islands Bill pending in Congress.

RESPONSE: No response necessary.

6. COMMENT: What persons or agencies will be responsible for enforcing and monitoring Section 505.9(c), (d) and (e)?

RESPONSE: The Part 500 regulations serve two purposes: provide minimum standards which must be met by local coastal erosion management programs; and, by the Department when it regulates a coastal erosion management program. In the latter case the Department’s Regional Permit Agents would administer the regulations. In the former, each municipality or county must determine how it will administer its local program. See Sections 34-0105, 34,-0106 and 34-0107 of the Act for the conditions determining the implementing unit of environment.

7. COMMENT: We question whether the Section 505.10(b) proposed setbacks for movable structures within hazard areas is adequate.

RESPONSE: The setback distances were established with regard for all factors.

8. COMMENT: In Section 505.10(c), the setback requirements for non-movable structures protected by erosion control devices need clarification. What are the setback requirements for non-movable structures not protected by approved erosion protection structures?

RESPONSE: The setback requirements for non-movable structures will vary with the effectiveness of the erosion protection structures protecting the site. That calculation will be made on a case-by-case basis. New non-movable structures or major additions to existing structures are not allowed in a structural hazard zone unprotected by an approved erosion protection structure. Refer to Section 505.7(b).

9. COMMENT: As mentioned earlier, we are somewhat skeptical of the effectiveness of the erosion protection structures (505.9(b)). A great deal of controversy exists as to whether such devices have demonstrated success in controlling long-term erosion.

RESPONSE: These regulations are meant to govern activities throughout the coastal waters of New York, including the Hudson estuary and the Great Lakes. Structural solutions in these areas are more feasible than on the south shore of Long Island. The regulations have been written as performance standards to enable the use of criteria specific to the site in question when reviewing plans for structural controls.

P. THE CITY OF NEW YORK

Howard Golden, President of the Borough of Brooklyn

1. COMMENT: The New York State Coastal Management Program provides an innovative approach to public waterfront policy, in that the review process is equally and separately implemented at the state and local levels. This is particularly evident in the application, a major portion of which is New York City's own management program. Although the local program differs from that of the State's through the added inclusion of land use review procedures, the two programs are integrally linked under the environmental review process.

RESPONSE: No response necessary.

2. COMMENT: The interrelationship of the State and City environmental quality review processes will determine whether the State CMP can be deemed adequate. It is imperative to note that a separate and identifiable local process is required under the proposed NYCWRP to implement the State CMP.

RESPONSE: The adequacy and approvability of the State's CMP and the WRP is based upon the enforceability of their respective laws, regulations and associated processes. SEQR is only one of the processes that will be utilized by both governments. When this process is used by the City, the departments of City Planning and Environmental Protection will serve as co-lead agencies in accordance with Executive Order No. 91. If an action involves both City and State agencies, the lead agency is determined by the procedures

contained in E.O. No. 91 and Sections 617.6 and 617.7 of SEQR. When an action is subject to both ULURP and SEQR, the City's designated agencies will, in most instances, be the lead agencies for SEQR purposes. In either situation, the decisions of involved State agencies must be consistent with the policies of the State's CMP and the City's WRP, as required by Article 42 of the Executive Law.

3. COMMENT: The costs of implementing this local environmental mechanism and coastal management policies make it crucial that the State plan provide a work program and funding commitments which meet the needs of our local efforts. Although this commitment is not required under the Federal application process, it is necessary in evaluating the benefits to be derived from the City's continued participation in the program and its relationship to the State's environmental process. Certainly, the City's withdrawal from or disapproval of the program could only lead to delaying this application (an identified alternative in the Draft EIS).

RESPONSE: As stated in the comment, the preparation of a work program is not a requirement for approval of either the NYS CMP or the NYC WRP. Further, as of this writing, Congress has not yet appropriated sufficient funds for the State CMP. Therefore, even if required, a commitment of funds would be impossible to make. The Program document and EIS being considered for Federal and State approval does not contain the reference to the alternative identified in the above comment. For your information, withdrawal from, or disapproval of the NYC WRP, would not affect the schedule or status of the NYS CMP or its application for financial assistance.

4. COMMENT: These comments, as well as my original testimony, are not critical of the Coastal Management Program as proposed. In fact, I am supportive of the potential benefits derived from New York City's cooperative efforts and comprehensive submission.

RESPONSE: Thank you for your support. No further response needed.

5. COMMENT: In order to insure an adequate response to five years of planning, it is essential that I understand whether a proper allocation of resources is associated with this program.

RESPONSE: Approval or denial of approval of the NYS CMP and/or the NYC WRP is not contingent on the availability of funds. As stated above, as of this writing, Congress has yet to appropriate these funds. Further, the primary benefit of this program, as explained in the Alternatives and other sections of the document is not the funds which relate directly to the Programs, but the consistency provisions of the Federal Coastal Zone Management Act and the State's Waterfront Revitalization and Coastal Resources Act. The first Act requires Federal activities to be consistent with State policy. The second, requires State agencies to be consistent with those same policies, as well as identified actions of approved local WRPs. These provisions, plus others will for the first time require all activities -- Federal, State and local -- within the coastal area, to accomplish the State policies for waterfront revitalization and coastal resources protection, without conflict or redundancy.

Q. NEW YORK COMMUNITY BOARD NO. 4

Hilda Regier
Rose Mary Lynch
New York

1. COMMENT: The Draft Environmental Impact Statement of the State of New York Toaster Zone Management Program does not address the revitalization problems of the Waterfront of the west side of Manhattan and the specific needs of Community Board No. 4 in relation to the waterfront, i.e., shipping and possible recreation spots. This report should be expanded to include the revitalization problems of the waterfront as mentioned above. The waterfront within the Board No. 4 area should be designated as a special revitalization area.

RESPONSE: The DEIS and NYS CMP address the principal issues facing the entire coastal area of the State. These issues fall into three categories: the need to wisely develop coastal resources; the need to protect coastal resources; and the major activities which will occur in the coastal area and which affect numerous coastal resources. The State CMP includes the regulatory framework within which these issues are addressed. The NYC WRP provides specificity to the State policies designed to address those three major categories of issues. These more detailed conditions placed on the broader State policies are implemented by State authority as well as existing City regulatory measures. Specific problems of any particular coastal area of the State, including the west side of Manhattan will be addressed within this regulatory framework upon approval of both the NYS CMP and the NYC WRP.

The west side of Manhattan has already been designated as an Area of Particular Waterfront Significance in order to address specified problems related to that stretch of the shoreline. The area extends from the Battery to 72nd Street.

R. WESTCHESTER COUNTY DEPARTMENT OF PLANNING

John W. Meunzinger

1. COMMENT: DOS regulations Part 601.4 should be changed from requiring the sending of a copy of LWRP to “the county wherein the LWRP area is situated” to requiring sending a copy to the county planning board on agency.

RESPONSE: Each county can make its own arrangements for internal distribution and review.

2. COMMENT: The proposed amendments to SEQR do not relate well to the existing language and format of Part 617 and should be revised. For example, adding the provision of consistency of State actions within the coastal area to Section 617.9(c)(3) does not give the attention needed to this major element of the program. The thought also does not seem to relate to this paragraph to which it is being added.

RESPONSE: Section 617.9 is the most appropriate location in the SEQR regulations the addition of the consistency determinations required by Article 42. That section requires the

findings for the State Environmental Quality Review Act. Without altering the existing SEQR process, the proposed amendments will assure that the coastal policies will receive the consideration required by Article 42 and necessary for the achievement of the policies and purposes of New York's coastal program.

3. COMMENT: The language is not totally clear in Section 617.14(f) (10), but the intent is obvious. A key word appears to be missing..."The identification and discussion shall instead be of the potential affect, if any, on the applicable policies and purposes of such an approved local waterfront revitalization program."

RESPONSE: We agree. See revisions to Section 617.14(f)(10).

4. COMMENT: Language should be added to Part 601 and the Local Government Guidelines to strongly encourage consultation with adjacent communities during the development of a local waterfront revitalization program.

RESPONSE: Agreed. Appropriate language has been added.

5. COMMENT: Article 42 should be amended or sufficient language should be included in Part 601 and in the Local Government Guidelines to provide for a review of the consistency between county policy and a local waterfront re-vitalization program before it is approved by the Department of State.

RESPONSE: See Response to Comment III, A, 2.

6. COMMENT: There should be a provision for the development of County coastal plans for areas of the coastal zone under direct County jurisdiction and management.

RESPONSE: Article 42 provides for the development of a local waterfront revitalization program by cities, towns, and villages. Their legal jurisdictions cover all areas within the CMP boundary, even though counties and other governmental entities may own, lease, or administer property within the boundary of a local government. The Department of State regulations (Section 601.4(3)) do provide counties the opportunity to review and comment on proposed local waterfront revitalization programs prior to approval by the Secretary of State. However, giving an option to allow a county to prepare a WRP would be contrary to Article 42.

S. COMMUNITY BOARD NO. 1 STATEN ISLAND

Thomas La Manna
New York

1. COMMENT: Criteria should be established to ascertain priorities when conflicts arise between different proposed waterfront policies, activities, and uses. For example, while the program places emphasis on economic revitalization and port development, it does not suggest when that use should or should not supersede other coastal uses.

RESPONSE: See Response to Comment III, K, 5.

2. COMMENT: The Staten Island waterfront from the St. George Ferry Terminal to the Pouch Terminal is requested to be included as a shorefront Access Area; the region

including the Arthur Kill, Kill Van Kull and adjoining wetlands is requested to be included as an Area of Particular Waterfront Significance and that a Task Force of agency representatives, community groups, and environmentalists be established.

RESPONSE: Refer to Response to Comment III, M, 3.

3. COMMENT: The CMP does not include a work program for carrying out the policies it presents.

RESPONSE: Section 4 of the CMP DEIS discusses detailed program management activities that are required to implement coastal policies. In addition to these detailed activities, annual work programs will be prepared by the Department of State and communities with approved local waterfront revitalization programs. See Part II, Section 10 for an overview of the first year of program implementation.

T. ST. LAWRENCE-EASTERN ONTARIO COMMISSION

Daniel J. Palm, Ph.D.
Executive Director

1. COMMENT: Pages 47-52 - This section could be strengthened by reference to Chapter 701, Article 37 of the Executive Law that established the St. Lawrence-Eastern Ontario Commission.

RESPONSE: Agreed. See revision.

2. COMMENT: Page 114 Section 6, Coastal Policies and Implementation would be strengthened by referring to Chapter 701, Article 37, Paragraph 847-g, (Project Review). For example, this legislation specifically addresses policies 23, 24 and 25.

RESPONSE: The purpose of this Section of the document is to state and explain coastal policies and describe the means for their implementation throughout the State's coastal area. The referenced State law applies only to the SLEOC service area, and therefore cannot implement policies Statewide.

3. COMMENT: The above 2 items are set forth in a positive sense to reflect that during the past 12 years New York State has implemented coastal resource management along the eastern end of Lake Ontario and along the St. Lawrence River through the Commission.

RESPONSE: Agreed. The Commission has also had a major role in the development of this Program.

4. COMMENT: The Commission is fully supportive of the program set forth in the DEIS under review. It further hopes that review and approval will be timely.

RESPONSE: Thank you for your support. No further response needed.

U. BONNIE JUNE MELLON

1. COMMENT: Approval of the DEIS would be in violation of New York's environmental policy to enhance the health, safety and welfare of the people of the State set forth in Article 1 of the Environmental Conservation Law.

RESPONSE: We disagree. The State has certified that the coastal program is consistent with State law. The U.S. Department of Commerce reviews the program for compliance with the Federal Coastal Zone Management Act.

2. COMMENT: The DEIS completely ignores important scientific and oceanographic data revealing hazards to people residing in oceanfront communities on Western Long Island.

RESPONSE: During the development of the Coastal Management Program and preparation of the DEIS, a great number of documents and site-specific studies were reviewed but not all of them were cited in the DEIS.

3. COMMENT: The DEIS omits reference to Article 2B, NYS Executive Law.

RESPONSE: See revision, suggestion incorporated. (See Policy 11)

4. COMMENT: Waves have not been added to the storm surge elevation for flood insurance for the City of Long Beach oceanfront which is devoid of sand dunes. Rezoning for new oceanfront high rise residential buildings has been enacted by City of Long Beach officials.

RESPONSE: A wave height analysis is being added to the City's Flood Insurance Study: the amendment was delayed to develop a new topographic base map for the City and it is expected that the draft study will be made available by the Federal Emergency Management Agency in early October, 1982. Zoning is, of course, a local government power, however participation in the federal flood insurance program, including the regulation of activities in flood-prone areas, is required by State law.

SECTION 3 – RESPONSE TO TESTIMONY RECEIVED AT JOINT FEDERAL AND STATE PUBLIC HEARINGS ON THE DEIS

A. Charlene Caile, representing:

Erie County Executive Edward J. Rutkowski

(Written Testimony Submitted)

1. COMMENT: Lake Erie and Niagara River are important to the area for water supply, fishing and swimming purposes. Also, public investment made to improve the quality of these waters requires protection.

RESPONSE: No response necessary.

2. COMMENT: The guidelines for the development of local waterfront revitalization programs do not give recognition to county-wide issues or the need to coordinate such local efforts with county plans and programs.

RESPONSE: The guidelines have been modified to direct coastal municipalities to undertake a comprehensive analysis of their entire waterfronts in developing the local programs. This analysis will address local and area wide concerns as well as considerations of the plans and programs of other governments affecting the waterfronts. The Department of State's regulations (Section 601.4(3)) provide counties the opportunity to review and

comment on proposed waterfront revitalization programs prior to approval by the Secretary of State. This review procedure offers counties the chance to raise issues or coordinate concerns that may not have been adequately addressed by a coastal community.

3. COMMENT: The guidelines do not clearly indicate whether projects applied for by counties have to be situated in localities with approved waterfront, vitalization programs. Such projects should be eligible for funding in coastal communities with or without an approved local program.

RESPONSE: Under the provisions of Article 42 of the Executive Law, only cities, towns and villages would be eligible to receive funding. Plus, any project-related funding must be for “activities which serve to facilitate construction projects provided for in an approved waterfront revitalization program” (Section 918(1)(b) of Article 42, Executive Law). However, should a community elect to so provide, a county could be the recipient of funds on behalf of that community.

- B. David Stebbins, representing:

City of Buffalo, Division of Planning

(Written Testimony Submitted)

1. COMMENT: The City of Buffalo strongly supports the NYS Coastal Management Program and urges its approval by the federal government to insure a successful waterfront revitalization effort in the City. The Program represents a workable and effective approach for balanced management of coastal resources and by using existing authorities will promote the beneficial use and prevents the impairment of those resources.

RESPONSE: Support appreciated; no further response necessary.

- C. Frances F. Dunwell, representing:

New York Coastal Coalition

(Comments presented at the public hearing in Albany were contained in written testimony submitted on July 20, 1982. The following comments are from that written testimony)

1. COMMENT: The proposed amendments to the SEQR regulations are confined to significant actions by state agencies. These proposed changes are in violation of the intent of Article 42 of the Executive Law and the mandate contained in Section 919(3) of that Article.

RESPONSE: The proposed amendments to the SEQR regulations cover all “Type I” or “Unlisted Actions” as defined in Part 617, Section 617.2, not just significant actions. See proposed Section 617.5(d).

Section 919(3) is contained in the section entitled “Coordination of state actions and programs” (emphasis added). Both subdivisions, one and two of Section 919 address state agency actions only. In that context, subdivision three is interpreted to apply only to state agencies. This interpretation is also in accord with the debate in the State Legislature on Article 42.

2. COMMENT: Language, regarding coastal resources, should be added to the list of criteria contained in Section 617.11 which are used in determining the significance of an action under SEQR.

RESPONSE: Coastal resources considerations are incorporated in the determination of significance by the required use of the Coastal Assessment Form (CAF) prior to any determination of significance under SEQR. See Section 600.4 of the proposed Department of State (DOS) Part 600 regulations.

3. COMMENT: Various environmental criteria in the proposed CAF should be incorporated into the Environmental Assessment Form (EAF) contained in the existing SEQR regulations.

RESPONSE: This recommendation would not alleviate the need for the CAF since not all the criteria in the proposed CAF are “environmental” and, therefore, suited for addition to SEQR and its EAF. It would also be inappropriate since the EAF is used by all agencies, state, county and local, and for all actions, both inside and outside the coastal area. The authority of Article 42 - and thus the CAF - is limited in scope to state agencies acting in a coastal area.

4. COMMENT: The Type I list in Section 617.12 of the SEQR regulations should be amended to include certain features that are important to the coastal program such as significant fish and wildlife habitats, import agricultural lands and other ecologically sensitive areas.

RESPONSE: The Section 617.12 Type I listing is primarily a catalog of actions likely to impact on the environment because they exceed certain thresholds keyed to either magnitude or location. To add certain actions to that list because of their coastal features alone would alter the nature of the existing listing.

Also, as indicated similarly in other responses, the suggested change would affect local as well as state agencies and without regard to the location of the actions. Article 42’s authority extends only to state agencies acting in a coastal area.

5. COMMENT: Language should be added to SEQR, Section 617.9 to clarify that determinations of consistency pursuant to Article 42, reflected in the proposed amendments to DEC Part 617, Section 617.9, do not require the granting of a permit or other approval which would otherwise be denied pursuant to any other state law.

RESPONSE: None of the findings required by Section 617.9 of SEQR require approval of an action which would otherwise be disapproved. SEQR is simply the mechanism for assessing, analyzing and weighing the environmental impact of an action to be taken by an agency in achieving some program objective. It assures minimization or avoidance of adverse environmental impacts of an action to be undertaken by an agency but it does not and cannot authorize or require that an action be taken which an agency could otherwise not take pursuant to the dictates and standards of the program it is implementing.

6. COMMENT: Permits are not subject to a consistency determination unless they are determined to be a significant action and thus subject to an EIS under SEQR. This is a significant loophole in the regulations.

RESPONSE: Article 42 does not contain the authority for subjecting permit transactions of State agencies to the Part 600 regulations unless the action has been identified by the Secretary pursuant to Section 916(1)(a) of Article 42 or is subject to SEQR and has the potential to significantly affect the environment, thus requiring an EIS. The federal CZMA requires States to manage land uses having direct and significant (emphasis added) impacts on the coastal waters; thus the significance test is not a loophole but is in compliance with the Federal Act, and specifically regulations 23.11(b)(1).

7. COMMENT: The CAF form should be amended to direct that a “yes” answer to any question pertaining to natural resources requires the preparation of a lone form EAF. This will link the CAF to SEQR.

RESPONSE: The purpose of the CAF is to assist state agencies in assessing the potential impacts that their actions may have upon the achievement of coastal policies. The CAF is also intended to supplement the EAF in determining the significance of proposed actions. This link to SEQR is accomplished by requiring (in Section 600.4) that the CAF be completed prior to any SEQR determination of significance. This connection has been further clarified by the revisions to Section 600.4.

8. COMMENT: In DOS Part 600 regulations, no reference is made to nor are there requirements for the use of the explanations and guidelines which accompany the coastal policies in the CMP DEIS.

RESPONSE: Revisions have been made to Section 600.5 which identify, reference, and clarify the purpose and use of the explanations and guidelines.

9. COMMENT: Rule-making should not be exempt from the consistency requirement.

RESPONSE: Debate in the Legislature on Article 42 indicated that they did not intend the enactment of a measure which imposed additional general regulatory requirements. In S919(1) of Article 42 the listing of the types of actions directly undertaken by state agencies that must be consistent with coastal policies does not include rule-making actions. Note further, that in situations where the Legislature intended rule-making actions to be covered in other contexts, express inclusion of rule-making is found. See, e.g., Environmental Conservation Law, § 8-0105.

Rule-making actions nevertheless must be the subject of a Coastal Assessment Form. This form would provide notification to the Secretary and an opportunity for discussion of proposed rule-making actions which may affect coastal issues. Also, those rule-making actions for which an environmental impact statement is prepared pursuant to the SEQR regulations (Part 617) would be the subject of analysis which must include the coastal policies since the amendments to Part 167 require this (see proposed addition to Part 617.14(f)(10)).

10. COMMENT: The words “the preservation of” should precede the words “those natural resources” in the first sentence of Section 600.1(c).
- RESPONSE: The language of DOS Part 600, Section 600.1(c) is a restatement of the legislative intent contained in Section 910 of Article 42.
11. COMMENT: The policies in Section 600.5 of DOS Part 600 regulations should be amended and state the need to protect fish and wildlife habitats in general.
- RESPONSE: Several existing laws, while their principal intent is not directly focused on habitat protection, already afford considerable protection to fish and wildlife habitats. Some of the more noteworthy laws are the Fresh Water and Tidal Wetlands acts, Protection of Waters Act, State Pollutant Discharge Elimination System and the Solid Wastes Management Act.
12. COMMENT: The policies in Section 600.5 provide no protection to fish and wildlife habitats, except those identified as significant, from adverse impact resulting from toxic chemicals and other pollutants.
- RESPONSE: Several policies contained in the CMP/DEIS specifically provide protection to these habitats from the adverse effects of hazardous wastes and other pollutants. Policies numbers 30, and 33-40 address the concern raised, but are not in section 600.5 regulations for they are already a part of other existing State law.
13. COMMENT: Public access to publicly owned lands, which have been acquired to protect fragile natural resources and could be threatened by public access, should not be mandated.
- RESPONSE: The explanations and guidelines in the CMP/DEIS for both public access policies give recognition to the harm that may result to fragile resources from overuse. In addition, the second policy specifically states that access be “...provided in a manner compatible with adjoining uses.”
14. COMMENT: The proposed DEC Part 505 erosion regulations should be amended to include a schedule for designation of those areas within a year of program approval.
- RESPONSE: Deadlines for designation of those areas are contained in Article 34 of the Environmental Conservation Law. NYS CMP funds, which are contingent upon Congressional approval, will be provided to the DEC to ensure that the designation of erosion hazard areas will be expedited. The target date for the completion of the designation process is October of 1983.
15. COMMENT: The DOS Part 601 regulations should be amended to require that a local government be consistent with its approved waterfront revitalization program.
- RESPONSE: Consistency is already required by Section 601.6(b) which authorizes the ultimate sanction or revocation of approval. However, this has been further clarified by revisions to Section 601.6(a).

16. COMMENT: Part 601 of DOS regulations should provide a notification procedure to alert the Secretary of State of local actions so that he is better able to monitor the progress of each local program.

RESPONSE: We agree. Section 601.4(e) has been revised accordingly.

17. COMMENT: State agencies, with programs that have the potential to affect TT waterfront program, have the opportunity to review and comment on every local program prior to approval by the Secretary of State. How will a negative comment from a state agency on a local program affect approval by the Secretary of State?

RESPONSE: Article 42 requires the Secretary to consult with those state agencies with programs affected by a local program. She/he must disapprove any program, if she/he finds after consultation that there is a conflict with any State or Federal policy. The regulations also require disapproval. See Section 601.3(3).

18. COMMENT: Mention should be made in the CMP document of the means for completing and updating the identification of significant habitats, scenic resources and agricultural lands.

RESPONSE: These important coastal resources will be completed and mapped on the Coastal Area map during the first year following program approval.

19. COMMENT: The economic development policies are overly broad and override certain existing protection for environmental resources.

RESPONSE: Each policy statement must be read together with all of the other policies. The balancing of competing policies, which is so vital to the success of New York's coastal effort and which was recognized as such by the State Legislature in Article 42, Section 912(1), will take place in the course of the SEQR process for those actions for which an EIS is prepared pursuant to DEC's Part 617 regulations, and in Section 600.4 of DOS's Part 600 regulations for all non-significant actions. The process of ascertaining consistency, as required in 600.4 and SEQR will result in decisions which balance all relevant coastal policies. See also revisions.

20. COMMENT: The guidelines applicable to the fish and wildlife policies are totally inadequate and overly restrictive.

RESPONSE: The explanation to the policy on significant fish and wildlife habitats has been expanded to include guidelines on activities likely to affect such habitats and physical, chemical and biological parameters.

D Bernard Melewski, representing:

Environmental Planning Lobby

1. COMMENT: The SEQR, Part 617 regulations should be amended to add coastal considerations to the Section 617.11 criteria which are to be used when making determinations of significance.

RESPONSE: See response to III, C, 2.

2. COMMENT: The environmental criteria in the Coastal Assessment Form (CAF) should be incorporated into Environmental Assessment Form (EAF) of the SEQR regulations.

RESPONSE: See response to III, C, 3.

3. COMMENT: The second sentence of the proposed Section 617.9(c)(iii) amendment to SEQR, pertaining to the required finding on a state agency action in an area with an approved local program - should be dropped and, instead, put in the Department of State's Part 600 regulations.

RESPONSE: In an effort to minimize the procedural requirements upon state agencies, consistency determinations on actions necessitating the preparation of an EIS were incorporated into the existing findings requirements of Section 617.9. The suggested revision to this section would require agencies to follow two different processes, thereby complicating rather than facilitating the agency's efforts to comply with the provisions of Article 42 and the SEQR law.

4. COMMENT: The SEQR "Type I" list should be expanded to include identified coastal resources.

RESPONSE: See response to III, C, 4.

E. Frances Hodson, Long Beach, New York

1. COMMENT: Section 8-0103 of the Environmental Conservation Law was omitted in Volume 2.

RESPONSE: This section is not directly related to the implementation of the program. It has been reprinted as an addendum to this volume.

2. COMMENT: The approval of water supply applications, particularly wells drawing large amounts of water, require public notice.

RESPONSE: No response necessary.

3. COMMENT: Local governments should be required to adhere to the coastal policies

RESPONSE: Local government involvement in the State's coastal program is voluntary. Therefore these units are not required by the Waterfront Revitalization and Coastal Resources Act to adhere to the coastal policies, unless a community has an approved waterfront revitalization program. Many activities involve various state programs. State agencies in implementing those programs must of course be consistent with the coastal policies.

4. COMMENT: The State's enabling laws mandate that local zoning regulations be adopted in accordance with a "comprehensive" plan.

RESPONSE: It is agreed that such regulations be in line with an overall plan; however, the enabling laws do not require localities to adopt zoning regulations.

5. COMMENT: U.S. Army Corps of Engineers report of Long Beach was not included in the report.

RESPONSE: A number of Corps documents were consulted in the preparation of this draft EIS. Not all of them were cited.

6. COMMENT: No reference is made to the impact of salt water intrusion upon Long Island's groundwater.

RESPONSE: This subject is discussed in Part II, Section 5 under water resources. Policy 38 also addresses groundwater supplies, particularly those designated as primary source aquifers.

7. COMMENT: Dune protection and dune creation programs are not mentioned.

RESPONSE: The protection of landforms such as beaches, barrier islands and dunes are discussed on pages 11-20 to 21 in Part III of the draft EIS. Also, artificial nourishment activities such as rebuilding or creating beaches and dunes are covered on the above cited pages.

8. COMMENT: Valuable materials produced by the Corps of Engineers and the U.S. Department of Commerce relating to hurricanes, ocean storms, protection of the barrier beach were not used in the draft EIS.

RESPONSE: A number of documents prepared by regional, State, Federal and international agencies were consulted and cited in Part II, Section 5 under flood and erosion hazards, in reference to hurricanes, storms and barrier beaches.

9. COMMENT: No mention is made of the rising sea level.

RESPONSE: This subject is covered on page 11-5-11.

10. COMMENT: The draft EIS must be distributed to the public for review and recommendation. It should not be rushed through the public review process.

RESPONSE: Copies of the draft EIS were made available to the chief elected officials of all coastal cities, town, villages and counties, as well as other organizations, businesses and individuals prior to the scheduled public hearings. The review period for the draft EIS was for a period of 45 days.

11. COMMENT: There should be greater discussion of zoning and its effect upon civil rights.

RESPONSE: The State's Coastal Program does not rely upon zoning for implementation purposes.

12. COMMENT: The Department of Environmental Conservation may be better suited to protect the health and safety of the State's residents than the Department of State which is "more suited to the needs of developers".

RESPONSE: Specific responsibility for the State's coastal program was vested in the Department of State by the State Legislature. The Department's ongoing planning and local government responsibilities were a major factor in this decision. The State's coastal program is more than an environmental protection program, for it advocates the beneficial use as well as the protection of the State's coastal resources. The Department of Environmental Conservation will still have a major role to play in the coastal program; because it has jurisdiction over a number of resources protection programs such as wetlands, water and air quality and habitats.

F. Aurora Gareiss, representing:

Udalls Cove Preservation Committee, Citizens Advisory Committee Governing Board on Water Resources

(Written Testimony Submitted)

1. COMMENT: The approval of New York City's waterfront revitalization program ; supported, provided: the program is undertaken with or without Federal funding; the City's work program be developed with public participation; and, the work program include the designation of several special management areas and special staffing to enforce development regulations on the waterfront.

RESPONSE: Support for Program approval appreciated. The City's participation in the State's Program is dependent upon a determination by the City Planning Commission that adequate implementation funds are available. The Commission's decision will be made when funding levels are established.

2. COMMENT: The concept of the watershed would assist in determining the land-1747UTIMit of the coastal area.

RESPONSE: This concept was considered very early in the development stages of the State's coastal program. It was determined then that this concept was not uniformly practical, since its application would result in a coastal area extending in some places hundreds of miles inland. All of the uses in this vast area do not and would not have a direct and significant impact on coastal waters.

G. Mark Wainstock, representing:

Neighborhood Organizations and Citizens Outraged Against Lignite

(NO COAL)

(Written Testimony Submitted)

1. COMMENT: "Coalport - Staten Island" is a coal export terminal proposed to be built by 1986. If implemented, NO COAL believes the project will ruin the Island's North Shore, destroy an existing tidal wetland and counter New York State efforts to develop and implement a rational and workable Coastal Management Program. As a result of the project, the Stapleton/Clifton waterfront would cease to be scenic, have its historic character destroyed, cultural vitality sapped, investment in, and reuse of existing building stock dry up, and thwart efforts to apply local aesthetic conditions in the design of new

structures. Each of these potential results is apparently contrary to the considerations of Section 914.5 [915.5] of the Waterfront Revitalization and Coastal Resources Act.

RESPONSE: In addition to the LGWRP considerations mentioned above, a LGWRP must also, among other items, facilitate appropriate industrial uses requiring a waterfront location. Both the protection and preservation of resources and the provision for their beneficial use must be balanced and incorporated within a LGWRP. The Coalport - Staten Island project, should it be implemented, may or may not result in the effects described. However, once the New York State Coastal Management Program and the New York City Waterfront Revitalization Program are approved, the provisions of those programs will apply to all such activities in the defined coastal area.

2. COMMENT: NO COAL believes that there is pressure to “grandfather” New York City actions conducted to date from the application of future legislation, regulations, and guidelines emanating from Federal approval of the FEIS and Coastal Management Program. New York City should be made to adhere strictly to the final Coastal Management Program.

RESPONSE: In New York City, several types of actions which have complied with all SEQR requirements will not be subject to review under the City’s WRP. These include: public improvements to be constructed pursuant to the official City map and official drainage plans; a site selection, urban renewal plan or large scale development plan adopted prior to the effective date of the WRP; and any action which has been certified under ULURP prior to the effective date of the WRP. Any major modifications to the above types of actions will, however, be subject to review under the City’s WRP.

3. COMMENT: Is the Port Authority, as a bi-state agency, subject to NYS laws enacted in response to the Federally-mandated Coastal Zone Management Act?

RESPONSE: The Port Authority of New York and New Jersey is a state agency and as such required to adhere to the WRCRA. It should be pointed out that the Coastal Zone Management Act is an Act which encourages, not mandates states to participate. (Also see response to Section II, C.1.).

4. COMMENT: Add a fifth sub-paragraph to NYCRR, Title 19, Part 601.4(a) to read “(5) in New York City, community boards of affected littoral areas and relevant borough-wide civic/community organizations.”, or as an alternative and possibly in lieu of that change, the following could be inserted within the review procedure for LGWRP in Section 601.4: “The Secretary of State will give public notice and schedule public hearing(s) at affected site(s) no later than 30 days following LGWRP submission by the locality.”

RESPONSE: Local discussions should all have occurred by the time the local legislative body (in NYC, the Board of Estimates) votes to approve and submit the local program to the Secretary. Section 915(3) of Article 42 strongly encourages consultation with community based groups and others during program preparation. This has been adequately documented in the case of NYC.

5. COMMENT: Delete the words “if necessary” within NYCRR, Title 19, Part 601.3.

RESPONSE: We agree. The phrase has been deleted.

6. COMMENT: Add to NYCRR, Title 19, Part 601.7: “Withdrawal of approved LGWRP by locality will rescind further state funding and other assistance, if such funding or assistance is being provided, for local government’s LGWRP planning. Benefits under Article 42 of the Executive Law will cease as of the date of withdrawal.”

RESPONSE: We agree. See revisions to Section 601.7.

H. Sister Francis Gerard Kress, CSJ, representing:

Environmental Protection Committee of Community Board No. 1 in Brooklyn, and Greenport Civic Council

(Written Testimony Submitted)

1. COMMENT: Greenpoint and Williamsburg residents feel neglected since no public access to the waterfront exists in those areas.

RESPONSE: The NYS Coastal Management Program and the NYC Waterfront Revitalization Program contain provisions for the preservation and protection of existing access to the coast and provisions for increasing public access. Refer to the discussion of the provisions found under Policies 19 and 20 of both programs. Upon approval of the NYS Coastal Management Program, the shorefront access and protection requirements outlined in Part II, Section 7 of the Program document will be applied.

2. COMMENT: With or without financial support of the NYC Waterfront Revitalization Program, many things can still be done including public participation by those living and working in a particular area, and establishing a city wide advisory committee.

RESPONSE: No response necessary.

3. COMMENT: Specific areas of the Brooklyn waterfront should be evaluated and designated as wetlands and/or as areas to be protected.

RESPONSE: NYS’s Tidal and Freshwater Wetlands Act and Protection of Water Laws Act are the primary means of protecting wetlands. A discussion of how these Acts are used to implement the wetlands policy can be found after Policy 44 in the NYS and NYC program documents.

4. COMMENT: NYS should have a comprehensive plan for monitoring and managing the New York Harbor and Bight.

RESPONSE: After approval of the NYS Coastal Management Program, New York State intends to work with affected agencies and interests to develop agreements with such agencies in order to seek methods for more comprehensive management of the Harbor.

5. COMMENT: Various NYC agencies should have been involved in the preparation of the Program and should be involved in its implementation in cooperation with NYC Community Boards.

RESPONSE: During the six years utilized by the NYC Planning Commission to prepare the NYC Waterfront Revitalization Program, all affected City agencies were consulted. They provided significant information and comments used in shaping the program. As a result of the consistency provisions of the NYS and NYC programs, all affected agencies must adhere to the program. Further, NYS and NYC fully intend to involve appropriate agencies in specific activities during program implementation.

I. Virginia M. Dent, representing:

N.Y.S. Northeastern Queens Nature and Historical Preserve Commission

(Written Testimony Submitted)

1. COMMENT: The purposes of the Commission, the Federal Coastal Zone Management and the State's Waterfront Revitalization and Coastal Resources Act were outlined to demonstrate the mutual concerns of each. Also, the Commission expressed its intent to cooperate with the Department of State in the implementation of the State's coastal program.

RESPONSE: No reply necessary.

2. COMMENT: Despite Article 42 of the Executive Law, New York State must devise and legislate an implementation program. Local governments can help the Department of State in performing this task.

RESPONSE: This document is a description of the implementation program for the Coastal Management Program. Local governments can aid the Department in carrying out the program, if they choose to participate. Their efforts will add greater specificity to the State's Coastal Program.

3. COMMENT: Specific activities and projects sponsored by the Commission were identified. Several are being undertaken in cooperation with the City of New York, including a reuse plan for Fort Totten which has been declared surplus by the Federal government.

RESPONSE: No reply necessary.

4. COMMENT: The Commission's program - consisting of the identified activities and projects - should be included in the final EIS on the State's Coastal Management Program. The Commission views this program comparable to the City's waterfront program which is included in the draft EIS.

RESPONSE: Article 42 of the Executive Law requires State agencies' programs to be conducted consistent with coastal policies, not incorporated into the program document.

J. Bea Green, New York, New York

1. COMMENT: There are access problems associated with Gateway National Recreation Area and Broad Channel which should be addressed by the NYC WRP. Various public agencies often work at cross-purposes with one another, leading to piece-meal planning.

RESPONSE: Public access to the shorefront is one of the major concerns of the NYS CMP and the NYC WRP. A shorefront access planning process is included in the CMP which will result in a list of specific access improvements to which the State will give priority, within financial and legal limits. The NYC WRP designates several shorefront areas as appropriate for improved access, including those Gateway areas with no access.

One purpose of the NYS CMP is to coordinate plans and projects of various agencies for the coastal areas to ensure that State and local coastal policies are being followed, thus preventing actions occurring at cross purposes.

K. Sarah Chasis, representing:

Natural Resources Defense Council

(Comments presented after public hearing in New York City were contained in written comments submitted on July 26, 1982. The following comments are from those written comments.)

1. COMMENT: It is a significant achievement that the State has finally developed a comprehensive management program for its coast. Many years of effort went into this program.

RESPONSE: No response necessary.

2. COMMENT: The relationship between the program document and the regulations is' wear. Nowhere do the regulations that bind the state agencies to the coastal Policies refer to the program document itself. As a consequence, the legal effect of the policy explanations and guidelines is unclear.

RESPONSE: We agree that the relationship between the regulations and the program document was unclear. The regulations have been amended to clarify and explain that relationship by stating: In evaluating proposed actions against the following policies, explanations and guidelines contained in the approved Coastal Management Program document..."

3. COMMENT: There are no policy guidelines for some of the most important policies, such as the protection of significant fish and wildlife, habitats.

RESPONSE: See revisions which incorporate detailed policy guidelines. Also, see Response to Section I, B, 3.

4. COMMENT: State permitting decisions are governed by the coastal policies only if the proposed action is deemed significant under SEQ. Since only a small portion of state permitting actions meet this test, the vast majority of activities permitted by the state will go unregulated under the program. To remedy this deficiency, NRDC recommends that if any answer to Part (e) of the Coastal Assessment Form (p. 626) is answered "yes" the action automatically should be deemed significant for purposes of SEQ. This would ensure that actions having a significant impact on the coast and the coastal policies conform to the coastal policies.

RESPONSE: Refer to the Response to Comment III. C. 6. In addition, it must be pointed out that the CAF is designed and intended for use as a coastal impact assessment tool for state agencies, similar to the use of the EAF for environmental impact assessment in DEC's Part 617. No single response to any inquiry on either form is a form indication of the existence of significant impacts or the lack thereof. However, once a state agency act on is in fact determined by that agency, after completion of the CAF, to have the potential to impact on the environment, then the proposed amendments to Part 617 to insure that the action -- including a permit action -- will be consistent with the DOS Part 600, Section 600.5 coastal policies.

5. COMMENT: No mechanism or guidelines are provided for resolution of conflicts between and among the coastal policies. Many of the development policies are too broad sweeping and unbalanced. For instance they fail to acknowledge that preservation of natural resources may be preferable to development in certain areas.

RESPONSE: Refer to the Response to Comment III. C. 19.

6. COMMENT: The guidelines must reflect a recognition that certain water dependent uses and facilities may be inappropriate for certain locations because of their adverse environmental impacts.

RESPONSE: Refer to those guidelines for additional clarifications.

7. COMMENT: Policy 3 guidelines are totally unacceptable. They, in essence, approve in advance major port expansions. They provide for an override of other coastal policies.

RESPONSE: This policy is limited as all policies are limited, by the requirement that an action must be consistent with all applicable coastal policies. Language has been added to clarify this requirement. See revisions.

8. COMMENT: Policy 3, Port Activity is nowhere limited to water dependent port activity.

RESPONSE: Guideline 1 states that "in assessing proposed projects within or abutting a major port, the overriding consideration is the maintenance and enhancement of port activity which will have precedence over non port related activities". The intention of this guideline is that port related water-dependent activities have precedence over non water dependent activities. The guideline will be revised to more clearly state that within port areas port related activities, i.e., land use or development essential to waterborne transportation, should take precedence over development that is not related to waterborne transportation.

9. COMMENT: Why should all port dredging be deemed of statewide or regional benefit upon such a meager showing as need and acceptable environmental impacts. Guideline 5, dealing with landfill, should be struck.

RESPONSE: Neither guideline is as sweeping as the comment suggests. They will, however, be modified to make clear that acceptable environmental impacts are only those that would be permitted under all applicable environmental regulations.

10. COMMENT: Guideline 5 under Policy 3 seems overreaching.
RESPONSE: The guideline is not overreaching. However, revisions have been made to clarify the guideline.
11. COMMENT: Why is Policy 5 limited to large scale development only?
RESPONSE: The policy is not limited to large scale development. However, the explanation refers to large scale development as an example to explain the meaning of the policy statement.
12. COMMENT: Guideline 1, Policy 5 would seem to define all cities, built up suburban towns and villages, and rural villages as areas of un-concentrated development having adequate infrastructure and public services.
RESPONSE: Guideline 1 does not define these areas in this way, but as areas concentrated development which generally have adequate infrastructure and public services. The adequacy of an areas infrastructure and public services must still be assessed against the needs of the proposed development activity to determine whether this policy is being furthered by the action.
13. COMMENT: All water dependent uses should not be excepted from this policy.
RESPONSE: Agree, the text is to be revised to except only water dependent uses with specific site requirements not compatible with this policy.
14. COMMENT: All second home development should not be excepted from the policy on encouraging concentration of development.
RESPONSE: Second home development should be excepted from this policy. However, second home development is not excepted from any other coastal policy. Any development, including second home must be carefully sited so as to maximize the benefits of maintaining open space and public access and be consistent with coastal policies.
15. COMMENT: Policy 22 should require that the recreation provided be open to the public.
RESPONSE: The State does not have the authority to require that all private recreational development be opened to the public. Facilities using public funds will be opened for public access.
16. COMMENT: Many of the types of development listed in Policy 22 should not be sited right on the coast.
RESPONSE: The policy refers to both existing as well as new development, while many of these uses should not, or need not, have been located on the coast, they are there, and it is the intent of this policy that, if practicable, they should provide for water related recreation as a multiple use.
17. COMMENT: Steam electric generating stations and transmission facilities are exempt completely from the coastal policies.

RESPONSE: Actions subject to Article VII and VIII of the PSL are exempt from SEQRA and thus from the procedures implementing Article 42. However, the level of environmental protection afforded under Article VII and VIII is equal to that of the coastal policies. In addition, the Secretary of State is a party to both proceedings and will present testimony on a facility's need for a shorefront location and its impacts on all coastal policies. Her/his testimony must be considered by the Board or PSC in reaching its decisions.

18. COMMENT: The explanation of Policy 28 is inadequate. To remedy this, NRDC recommends that the phrase P...if the proposed action is to be implemented..." be deleted.

RESPONSE: It is unnecessary to delete that phrase, since it would be unnecessary to avoid or mitigate adverse effects if the action was not implemented.

19. COMMENT: The OCS Policy (NO. 29) has no specific guidelines accompanying it, thus providing totally inadequate guidance for OCS activities.

RESPONSE: The discussion on oil and gas energy development planning processes has been expanded in the energy facility planning process section of this document. All activities including OCS must be consistent with the applicable policies.

20. COMMENT: The policy explanation for Policy 35 undercuts the natural resource protection intent of that Policy.

RESPONSE: The explanation of Policy 35 has been revised so it more accurately states the meaning of that policy.

21. COMMENT: Many of the important environmental policies (e.g., Nos. 7, 11-17, 24, 26 do not become effective until the state has either identified and mapped significant fish and wildlife habitat, scenic resources, and important farmlands or identified coastal erosion hazard areas. We could find no statement or commitment to a schedule for implementation of these tasks in the program. This is a major omission.

RESPONSE: Upon receipt of Federal funds pursuant to Section 306 of the CZMA, the State will complete these tasks during the first year grant period. See Section 10, Part 2 for more detail.

22. COMMENT: Policy 7 is weak in that it only applies to a range of habitats which is narrowly defined by the criteria listed for determining significance. These criteria are more stringent than in earlier drafts. Specific guidelines are needed governing uses affecting these areas of significance. A policy should be adopted to protect coastal fish and wildlife habitats not rising to the level of significance set in Policy 7.

RESPONSE: Until the signing into law of Article 42, New York had no law which directly focused on the preservation of fish and wildlife habitats. The protection of several habitats, however, were being provided for indirectly by existing resource protection laws such as the Tidal and Fresh water Wetlands Act and the Protection of Waters Act. The intent of Article 42 was to begin to meet this need by affording special protection to the particularly important or significant habitats. The criteria for determining which habitats are of statewide significance have not been made more stringent than as presented in earlier

drafts. The criteria “are essential to the survival of...population” and are found at a very low frequency within a coastal region” are the same as in the March 1979 draft CMP. A comprehensive policy protecting fish and wildlife habitats not rising to the level of significance set in Policy 7 was not adopted because such a policy would not have been enforceable under existing state law.

23. COMMENT: Specific guidelines should accompany Policy 9 and 10 in order to assure that sound resource management considerations are developed and adhered to.

RESPONSE: The NYS Department of Environmental Conservation is authorized under various sections of Environmental Conservation Law (see “State Means for Implementing the Policy” under respective policies) to regulate the utilization of the State’s fish and wildlife resources. Sound resource management considerations such as the biology of the species, carrying capacity of the habitat, and public demands, provide the basis for DEC’s decision on harvest restrictions, stocking programs and habitat improvement efforts. Any public or private initiatives to expand recreational or commercial use of the State’s fish and wildlife resources can only be done with DEC’s approval, thereby assuring that such initiatives will be done within the context of sound resource management considerations.

Additional guidelines for implementing policies 9 and 10, however, have been added to the policy explanations. Such guidelines will reinforce DEC’s regulatory efforts to manage these resources.

24. COMMENT: The standards and evidence set forth in the regulations should be referenced in Policies 11 through 17.

RESPONSE: It is sufficient to cite the authorizing legislation.

25. COMMENT: The last sentence of the Policy 15 explanation should be struck since there is no basis in the policy for such a statement.

RESPONSE: The cited sentence is essential to clarify that further off-shore mining may be an alternative to land mining.

26. COMMENT: Policy 26 should not be limited to only public actions affecting important agricultural lands. The policy by its terms is much broader and the program would not be achieving the intent of the statute if it limited the policy’s applicability so narrowly.

RESPONSE: Article 42 requires State agency actions to be consistent with the coastal policies. In terms of its applicability, Policy 26 is not limited any more than any other policy.

27. COMMENT: Policies 31 and 42 should acknowledge the provision of Section 307 which states that nothing in a State’s coastal program shall in any way lessen or impair standards set pursuant to the Clean Air and Water Acts.

RESPONSE: The explanations of policies 31 and 44 have been amended accordingly.

28. COMMENT: NRDC adopts the NYS Coastal Coalition comments on the SEQR and DOS regulations, wishing to emphasize the following:

- The caveat set forth in Sections 919(1) and 915(8) of the statute should be reflected in Section 617.9(c)(3) of the SEQR.

RESPONSE: Refer to the Response to Comment III. C. 5.

- The exception for rulemaking made in the DOS regulations in Section 600.4(2) must be eliminated in order to conform to the statute.

RESPONSE: Refer to the Response to Comment III. C. 9.

- The term “if necessary” should be deleted from the third to the last line of DOS regulations, Section 601.3.

RESPONSE: Refer to the Response to Comment III. G. 5.

- “May” should be replaced with “shall” in the first line of Section 601.6(b).

RESPONSE: We agree. Refer to Revisions.

29. COMMENT: Because the coastal erosion hazard area regulations do not go into effect until those areas have been identified by DEC, it is essential that a schedule for rapid implementation of this program and designation of these areas be included as part of the coastal program.

RESPONSE: Refer to the Response to Comment III, C, 14.

30. COMMENT: Section 505.5(e) fails to follow Section 34-0109(b) of the statute in discussing the applicability of SEQR.

RESPONSE: It is the opinion of the Department of Environmental Conservation that Section 34-0109(b) is not consistent with Article 8 (SEQRA) which is intended to ensure that actions which do have a significant effect on the environment are adequately reviewed prior to approval. There are situations under Article 34 where many regulated activities should it which could not reasonably be construed that they may have a significant effect on the environment. The statutory conflict between the two Articles will require subsequent resolution, and it is felt appropriate not to complicate further the situation by inserting additional matter in the regulations at this time.

- 31 COMMENT: New non-movable structures and major additions to existing structures should not be allowed in structural hazard areas except perhaps where structural protection already exists. To do otherwise is to encourage the building of new erosion protection structures in lieu of a non-structural solution which is contrary to the findings and spirit of the law.

RESPONSE: The underlying authority for the regulations, “The Shoreowner’s Protection Act”, does not prohibit the siting of structures, movable or immovable, but sets standards for their location including consideration of the protection afforded by erosion protection structures. However, the prominent placement of Section 505.7(b), before the requirements for movable structures contained in Section 505.7(c) may create the impression of a preference for structural measures. To avoid this, the order of the two sections is now

reversed. See also CMP Policy 17 regarding the use of nonstructural measures whenever possible.

32. COMMENT: Section 505.8(c)(7): this section should be changed to reflect the greater restrictions imposed on motorized vehicles in an earlier draft. Commercial fishing or emergency needs should be considered in permitting vehicular use of the beaches, but other uses should be prohibited.

RESPONSE: The latest draft continues the prohibition of vehicle use on primary dunes and bluffs but allows their operation on the more tolerant portion of beaches seaward of the upper debris lines and toes of primary dunes, thus assuring a virtually equal high level of protection while providing for reasonable use of a natural resource.

33. COMMENT: The limitations in primary dune development are excellent.

RESPONSE: No response required.

34. COMMENT: Section 50519(e) must be revised to state: “The construction, modification, or restoration of erosion protection structures will not be permitted if such activity will result in (1) a measurable increase in erosion at the development site and other locations; or (2) adverse effects on natural protective features, existing erosion control structures or natural resources”.

RESPONSE: Disagree: the section as drafted reflects the language and intent of Section 34-0108(3) except that the phrase, “significant fish and wildlife habitats” has been inserted in lieu of “fish spawning and shellfish beds” which is deleted.

L. Joseph Landau, representing:

Howard Golden, Brooklyn Borough President
(Written Testimony Submitted)

1. COMMENT: Supports the City’s efforts in developing a local coastal program. The program submitted by the City is very comprehensive.

RESPONSE: Support appreciated. No reply necessary.

2. COMMENT: One of two public concerns is to prevent unnecessary additions of bureaucratic red tape. The City’s program submission accomplishes this with an implementation process within existing laws and procedures.

RESPONSE: No reply necessary.

3. COMMENT: Other concern is one of providing adequate financing to implement the local program. It is not clear in draft EIS whether or not the City will receive adequate funds to implement its program.

RESPONSE: At the time of responding to the comments contained in the hearings testimony, the levels of funding to New York State and consequently New York City were unknown. An allocation for New York State of \$3 million has been discussed between

Federal and state officials. Funding for New York State under Section 306 of the Coastal Zone Management Act requires Congressional, appropriations.

4. COMMENT: There is no indication what elements or projects in the City's program will address the needs of Brooklyn's waterfront. Before the final EIS is issued, city and State officials should develop a work program and reach agreement on funding allocations.

RESPONSE: The Department of State has prepared a draft grant application covering the use of Federal funds over the next fiscal year. The process for allocating funds within the State is separate from the one governing the review and approval of New York State's coastal program.

M. Marilyn Vogel, representing:

NYC Citizens' Advisory Committee on Water Resources
(Written Testimony Submitted)

1. COMMENT: The NYC WRP should be adopted regardless of whether or not Federal 15074 is available.

RESPONSE: Adoption of the Program by NYC is an option whether or not Federal funds are available. However, the City's participation in the State's program will depend upon the availability and level of Federal and state implementation funds.

2. COMMENT: Public participation should be provided for in the implementation of the NYC WRP, including participation by the CAC WR.

RESPONSE: Proposals for program implementation will be solicited from and reviewed by the public through existing procedures. The Public participation mechanism to be utilized in New York City will be the 59 existing Community Planning Boards.

3. COMMENT: The Jamaica Bay/Rockaways/tributaries area should be designated as an Area of Particular Waterfront Significance and a task force created to make recommendations for policies and projects; policies should be developed to address problems in the Arthur Kill, Newtown Creek, the Brooklyn Waterfront, and the Northshore of Queens.

RESPONSE: Your recommendation is noted. Specific projects and proposals such as yours for areas within the coastal boundary for New York City will be solicited through existing channels from the public after approval of the NYC WRP. (Refer also to Response, Section III, N. 1)

4. COMMENT: The program should contain guarantees of enforcement provisions, through staffing.

RESPONSE: Approval of the WRP may make funds available that could be used to ensure that adequate enforcement is provided. In fact, the City's WRP strongly recommends funds be used for this purpose.

N. Thornton Willett, representing:

Kane Street Block Association

(Written Testimony Submitted)

1. COMMENT: The Coastal Management Program offers “fuzzy” goals without mentioning their implementation or enforcement.

RESPONSE: The DEIS lists 44 specific coastal policies in Part II, Section 6. Under each policy are described existing State programs and activities which can be used to implement and enforce the policy. In addition, the consistency provision of the Waterfront Revitalization and Coastal Resources Act (Section 919(1) of Article 42 of the Executive Law) requires that actions directly undertaken by State agencies in the coastal area are to be consistent with coastal policies. Also, when New York’s Coastal Management Program is approved, the actions of Federal agencies which impact the coastal area must be consistent with the approved program policies.

2. COMMENT: For numerous reasons cited, New York City’s City Environmental Quality Review process (CEQR) does not work and thus is greatly responsible for the deficiencies of the Coastal Management Program.

RESPONSE: See last response below.

3. COMMENT: The consistency provisions of the Coastal Management Program do not allow for verification or enforcement of the consistency determinations.

RESPONSE: Once the New York City Waterfront Revitalization Program is approved, all City agencies and actions must adhere to that program. To assure that the consistency provisions of LGWRPs are continually and uniformly enforced, the NYCRR, Title 19, Part 600 regulations have been changed to include provisions for monitoring of those programs during their implementation. See Section 600.

4. COMMENT: Several improvements could be made in the CEQR process which, in turn, would help the Coastal Management Program: (1) The Project Data Statement should include a cost benefit analysis; (2) The Project Data Statement should be sent to Community Boards and to appropriate City Departments; (3) The Department of City Planning’s involvement in the process should be eliminated.

RESPONSE: SEQR is now under public review for a new Executive Order. Furthermore, CEQR will be one of the means used to implement the WRP. The existing procedure is adequate for program approval purposes; however, improvements could be incorporated into the program.

O. Agnes Hentschel, Woodside, New York

1. COMMENT: Desires extension of greenbelts and open space from Gateway National Recreation Area along the shoreline to western Queens and Long Island City in order to preserve recreation and scenic amenities from high rise development.

RESPONSE: Policy F in the NYC WRP emphasizes the priority to be given to the development of mapped parklands and appropriate open space where the opportunity exists to meet the recreational needs of immobile user groups and communities without adequate waterfront park space and/or facilities. The identification of specific areas for open space

and implementation of projects will take place following WRP approval and will be subject to public solicitation and review.

P. Robert Alpern, representing:

NYC Citizens Advisory Committee on Water Resources

1. COMMENT: Regarding the NYS CMP, the CAC approves of the Program and makes these recommendations: (1) a statewide citizens advisory committee should be formed to oversee implementation of the CMP.

RESPONSE: A statewide advisory committee will be formed and support for it is included in a proposed first year work program.

2. COMMENT: Establishment of an area-wide Citizens Advisory Committee should be a precondition for State approval of all local Waterfront Revitalization Programs.

RESPONSE: Article 42 strongly encourages local governments to consult with all affected agencies and community based groups during the preparation of a local waterfront revitalization program. The DOS guidelines for LWRP indicate the need for broad local support. Such support would necessitate extensive public involvement. The precise form of such involvement may vary with each locality.

3. COMMENT: Consideration should be given to establishing a new State CMP policy on monitoring and control of physical modifications to the shoreline to avoid adverse cumulative effects.

RESPONSE: While no specific policy addresses the concern reflected in the above comment, specific coastal features -- dunes, beaches, wetlands, etc. -- the modification of which are of particular concern, are controlled by specific policies and specific adverse effects of modification are addressed in policies on access, water quality, dredging etc. Also, as to monitoring, the DOS will receive descriptions of, and comments upon, all major actions in the coastal area.

4. COMMENT: Consideration should be given to establishing a New State CMP policy on comprehensive monitoring and management of New York Harbor and New York Bight.

RESPONSE: The proposed first year work program includes a task that will address the issue of comprehensive management of the New York Bight including attention to cooperation with New Jersey and federal agencies.

5. COMMENT: Expand NYS Office of Business Permits master application program to include Federal, sub-state, and interstate permits.

RESPONSE: Article 42 requires that the Office of Business Permits shall conduct continuing studies of means of expediting development called for in approved programs. During the first year work program, the DOS will be working closely with the Office of Business Permits to identify and implement means for streamlining permit procedures in the coastal area.

Q. Maurice Hinchey, representing:

Member of New York State Assembly
Chairman of Environmental Conservation Committee
New York State Assembly

1. COMMENT: Urges the approval of the NYS Coastal Zone Management Program. The Legislature has worked closely with the NYS Department of State, Department of Environmental Conservation and other, involved agencies and passed the Waterfront Revitalization and Coastal Resources Act and the Shoreowner's Protection Act. The Legislature has been energetically working to fulfill the mandates of the Federal Coastal Zone Management Act in the establishment of a State plan. Without adequate Federal funding and approval of New York's Coastal Management Program, the prospects of prompt action consistent with the established federal program is considerably diminished.
RESPONSE: Thank you for your support.

Appendix B

New York State Guidelines for Local Waterfront Revitalization Programs

PART I – GENERAL GUIDELINES

INTRODUCTION

In 1981, the New York State Legislature enacted the Waterfront Revitalization of Coastal Areas and Inland Waterways law which established the first concerted statewide waterfront revitalization effort in the nation. This law represents years of private and public effort. Development interests, environmental interests, civic groups, and cities, towns and villages all played a vital role in shaping this law. The experiences of Boston, Baltimore, San Francisco and even the small city of Beaufort, South Carolina, clearly indicate that waterfront revitalization cannot succeed through the efforts of any single entity, either public or private. Hence, the major theme for the Waterfront Revitalization Program is that of consensus building to foster a strong private and public sector partnership that will achieve the single overriding purpose of this law: the advantageous use and protection of the unique characteristics evident in each of the State's 240 waterfront communities.

Since it is to become a major element in the implementation of the statewide coastal program in the coastal area within the community's jurisdiction, a Waterfront Revitalization Program must be comprehensive. In addition, to gain the community commitment to undertake the revitalization effort, the program must be focused and small enough to be grasped and accomplished within the foreseeable future and at the same time big enough to make a difference in the community's attitude toward its waterfront. Further, a Waterfront Revitalization Program must be exciting enough to maintain the community's interest and momentum over a long period of time. Without this long term commitment, a hodge-podge of poorly executed projects with no lasting value may result. A Waterfront Revitalization Program must also be flexible enough to allow for and encourage change. The completed Waterfront Revitalization Program must express a vision of what the waterfront can become, and a pragmatic strategy for achieving that vision.

A Waterfront Revitalization Program will contain policies which for the most part either promote the beneficial use of coastal resources (development) or prevent the impairment of certain coastal resources (protection). The emphasis in each program will vary since all localities differ in terms of development, economy, population, natural environment and social make-up. Thus, each local program will be unique and tailored to local conditions to best take advantage of what is present on the waterfront. At the same time, there are certain common requirements for preparing a program that must be observed. All programs must begin with an evaluation of the local waterfront, its assets and its liabilities. Such an evaluation may have already been undertaken in preparing an existing local plan and simply require refinement and updating. At the other extreme, a locality may be seriously looking at its waterfront for the first time. In either case, a locality should follow this and the other general steps listed below in preparing a program:

First, a community must see what's on the waterfront. It must identify all of the opportunities and problems, their interrelationships and complexities and understand what caused the waterfront to evolve into its present status.

Second, a community should establish a mechanism for obtaining public and governmental involvement in the development of a program.

Third, the locality must establish an approach for addressing the identified opportunities and problems, being mindful of the community's capabilities, the necessity to create the excitement and commitment needed for success, and the need to further those State coastal policies that apply.

Fourth, the locality must devise specific solutions in terms of uses, projects, or procedures to solve the identified problems, or to take advantage of the identified opportunities.

Fifth, the locality should develop specific management, funding, and legislative strategies for priority uses, projects, and procedures. At the same time, the locality must use existing or new enforcement capabilities to ensure that at a minimum, nothing will occur to prevent the long term advantageous use of the waterfront.

Sixth, the locality must present procedures for addressing potential waterfront opportunities and problems so that the community has the ability to address new situations as they arise.

In addition, to funds being available to assist in the preparation and implementation of a Waterfront Revitalization Program, a major benefit of an approved local program is the requirement that State and federal agency actions must be consistent with the details of a program.

GETTING STARTED

The initiative for undertaking a local Waterfront Revitalization Program lies with the individual local government or governments. The State encourages such a program, but the State's Waterfront Revitalization Program is not dependent on their existence. Where undertaken, however, it becomes a major element in the implementation of the State's coastal program.

Localities interested in undertaking a waterfront revitalization program should first contact:

Department of State
99 Washington Avenue, Suite 1010
Albany, New York 12231-0001

Such contact should be established at an early date. The Department of State can help an interested community in several ways:

1. *Assistance in Funding Local Program Development.*

The Department of State has received federal funds for use in preparing local programs. These funds will be available to match local cash or in-kind services for up to 50% of the cost of preparing a local program. Criteria for allocating the funds are:

- (a) the initiative shown by local government by the amount of local resources, fiscal and non-fiscal, committed to addressing coastal issues;

- (b) the relative significance a locality's coastal resources/activities have for that locality, the region, or the state;
- (c) geographical balance is desired but there will also be priority for contiguous localities, particularly whole counties or logical subregions such as the Long Island Sound shore of Westchester, the East end of Long Island;
- (d) the degree of coincidence between local coastal concerns and State and Federal priorities (access, water dependent uses, erosion, etc.);
- (e) the ability of the locality to successfully carry out the work;
- (f) commitment to implementing the program;
- (g) ability of locality to undertake work without a grant.

As to the amount of a grant, the factors to be considered are:

- (a) a, b, d, and g above;
- (b) the population of a community in total and within the coastal area and the number (in general terms) of people who make use of the coastal area.

2. *Technical Assistance and Advice.*

The Department has a staff of coastal and development specialists who are available to consult with municipal officials interested in undertaking waterfront revitalization. They will answer questions, suggest approaches, and provide needed services to launch the local program.

3. *Needed Tools.*

In beginning a Waterfront Revitalization Program, a locality will require special maps and data. The Department possesses a wide range of resources of this nature which it can make available.

CONTENT OF LOCAL PROGRAM

The following outline describes in detail the steps to be taken in developing an approvable local Waterfront Revitalization Program under the 1981 legislation, with suggestions and examples for local guidance. Most of the steps will be recognized as familiar planning activities generally followed in the course of undertaking any land use or economic development program. Because each local government's coastal situation is different, the design of a local program will vary. Adherence to the steps below will assist a community in determining its own waterfront policies and in determining which State coastal policies are relevant and are to be considered and dealt with in its local program. To gain familiarity with the scope of State waterfront concerns, a first step should be to carefully read the 28 State coastal policies. These policies, which are derived from Article 42, are found in DOS regulations, 19 NYCRR Part 600 and in Part II of these guidelines.

1. *Undertaking an Inventory and Analysis*

Before a community can design a local Waterfront Revitalization Program, it must first inventory and analyze its existing waterfront conditions. Many communities, of course, may have already done much of this work. Of assistance in this task is the State's Coastal Atlas, a copy of which is available to any interested coastal community. The atlas identifies the major coastal resources and

circumstances which must be recognized in a local program. Such items as important agricultural land, significant historic sites, important wildlife habitats, and major scenic vistas are indicated on the atlas maps. The State has also identified certain other coastal conditions, such as erosion and flood-prone areas, which may affect local programs.

Using the coastal atlas as a starting point, the local government should refine and supplement this information, based on a more intensive community study, particularly in the following areas:

- (a) Existing natural, recreational, cultural, aesthetic, and historic resources not accounted for in the state atlas, but of local significance.
- (b) Economic activities, particularly current or potential industrial and commercial uses dependent on a waterfront location.
- (c) Current land and water uses.

Analysis of inventory and other data should follow to determine the existence and significance of problems, issues, and opportunities that are related to the waterfront.

This analysis may indicate that much of the local waterfront is already in stable uses, such as residential, and presents no problem. However, analysis may also indicate that some important uses, such as agricultural lands, are threatened, and need local attention and solutions. Other waterfront areas may be identified as deteriorated, and provide the opportunity to promote new and more economically rewarding uses. These problem areas are the ones on which the local Waterfront Revitalization Program should concentrate.

2. *Determining Local Policies and Applicable State Policies*

Identification of the waterfront problems and opportunities on which the community program must concentrate should be linked to a determination of which of the policies and required activities described in Part II of the guidelines need to be incorporated in the local program. Three situations are possible. First, some policies may not be applicable to the community, for example, the policy on agriculture is not relevant to New York City while the policy on port development is not relevant to Niagara Falls. Second, some policies will reflect concerns which are not primarily responsibilities of local government. In such cases, the policies can be merely repeated in the local program. Third, many of the policies will be applicable to the community and must thus be elaborated upon and incorporated in the program. In Part II, guidelines are provided for determining whether and to what extent a policy or activity is relevant to the circumstances of the locality.

Based on the above analysis and determination, the municipal waterfront program should set forth specific local policies. In establishing the policies of a local program, the community should keep the following factors in mind:

- (a) be specific; general goals are not sufficient to provide direction to a program
- (b) establish priorities; all problems and opportunities cannot be fully addressed at once
- (c) stay within the community's capabilities, both fiscal and social
- (d) generate excitement and commitment

- (e) realize that the State policies are a minimum; if relevant to the locality, they should in most instances, be elaborated upon in the LWRP.

3. *Defining the Waterfront Revitalization Area Boundary*

A coastal area boundary has been designated for the entire State and is shown on the coastal area maps sent to each local government in 1981. The entire area within the designated boundary for the local government is to be included within the geographic area of a local Waterfront Revitalization Program. However, if it can be justified that the program's inland boundary should be altered, a recommendation should be made to the Secretary of State to revise the boundary accordingly.

Recommendations for the inland boundary of a local Waterfront Revitalization Program should be based on consideration of the following points:

Plot the geographic locations affected by coastal issues, problems, and opportunities found to be relevant and which are to be the basis for the determination of those policies and activities to be incorporated into the waterfront revitalization program.

Recognizable lines, such as cultural features (highways, streets, railroads, etc.) should, if at all possible, be used for the inland boundary.

4. *Identifying Uses, Projects, and Procedures*

The heart of a local Waterfront Revitalization Program consists of the identification of specific uses and projects, both public and private, proposed for the waterfront area. These must further each policy of the program and must be as specific as possible, considering the circumstances of the particular use or project.

While the proposed uses and projects should be long-term, this does not preclude attention to immediate problems nor staged implementation of a program so long as any major resources identified are adequately protected and major development opportunities are not allowed to be foreclosed. Also, proposed uses and projects can be identified by sub-areas that reflect neighborhoods or related uses or geography. The proposals should be very specific. Detailed sketch plans, preliminary cost estimates, and time schedules should be included so that implementation of the proposals can be furthered by an approved program.

Alternatively, where identification of specific uses or projects is not realistic, a locality may choose to establish a procedural mechanism(s) (such as a local Coastal Commission that reviews and approves waterfront activities, or amendments to an existing procedure such as SEQRA) to achieve all or some of the program's objectives. Such procedural mechanism(s) would provide that any proposed uses or projects meet certain standards. This approach can be taken for an entire program and may be most appropriate in a locality with an extensive and diverse waterfront. In that situation, the approach should be supplemented by the identification of a few specific projects. In other localities the approach taken may concentrate on several specific uses and projects and supplement that approach with procedural mechanism(s) that meet the policies not covered by identification of specific uses or projects.

5. *Identifying the Techniques for Implementing the Program*

The Waterfront Revitalization Program places great emphasis on implementation. In developing the specific management, funding, and program strategies, a locality may emphasize those priority uses and projects it has identified. However, at the same time it must also identify existing or new enforcement capabilities that ensure that, at a minimum, nothing will occur to prevent the long term advantageous use of the waterfront, or that would frustrate achievement of any identified local objective or relevant state policy.

Specifically, the State legislation requires a “description of proposed means for long-term management and maintenance of waterfront development and activities including organizational structures and responsibilities and appropriate land use controls.” A further section requires that the local program provide “specification of the adequate authority and capability of the local government to implement the program.” A “description of necessary and appropriate state actions for successful implementation of the program” is also called for. What is necessary to meet these several requirements is described below.

- (a) Local programs should include a complete description of the various means that the locality will employ to implement its program. The description should clearly indicate how the various means will achieve each of the policies or proposals contained in the program. Means of implementation are defined to include organizational structure, review procedures, financing, land use controls and other ordinances, etc. Part II contains a brief discussion under each policy or activity of various techniques available to local government for the given purpose. Localities are free to choose whatever means they feel suit their circumstances, provided that they can demonstrate that the means chosen are likely to be effective. Each policy/activity discussion in Part II also contains guidelines for determining whether the means chosen are adequate to achieve the policy or cause the activity to occur.
- (b) A local program should include a section which provides evidence that the community has the capability to achieve the policies stated in its program. Capability refers to: 1) legal capability, i.e. the local laws and ordinances identified as part of the program are or will be in place prior to program approval (the full text of any local laws or ordinances should be appended to the program); such legal capability should also include provisions that municipal agencies operate their programs consistent with the LWRP; 2) organizational capability, i.e. there is adequate staff to manage the program and a mechanism exists for coordinating the activities of municipal agencies within the waterfront revitalization area, and 3) financial capability, i.e. the projects and other program elements to be developed with local public funding are reasonable given the fiscal resources of the locality, and, to the extent private and other government financing are to be sought, that there is a likelihood that they can be obtained.
- (c) While it is necessary for a locality to demonstrate that it can successfully undertake a Waterfront Revitalization Program, it is recognized that many of the funding, regulatory, and direct activities of state agencies will greatly influence the successful implementation of Waterfront Revitalization Programs. The process of achieving the required consistency of State actions with local programs can be facilitated by local governments identifying those specific State agency actions (including proposed actions or classes of actions) and programs which are likely to affect achievement of the local program, either in a positive

or negative manner. Localities should describe how their program is affected and how each State program or action might be modified.

To aid localities in identifying programs, DOS will prepare a list of the major State agency programs which may affect waterfront revitalization. A locality should attempt to be as complete as possible in identifying such programs; however, failure to identify a program or action does not diminish the requirement that the program or State agency action be consistent with an approved local program, provided it is identified by the Secretary of State as such at the time of program approval. How consistency works is discussed in detail below under Benefits of an Approved Program. Localities may also wish to identify federal actions which would affect achievement of the local program.

6 *Obtaining Local Commitment*

Finally, the local waterfront revitalization program must be geared to produce results. Once approved by the State, State agencies and federal agencies may not undertake action in conflict with the approved program.

Because such a program represents partnership efforts, a firm local commitment to the proposed program is expected before State action is taken on the submission. Local commitment requirements are satisfied by:

- (a) Approval of the program by the mayor, supervisor and manager, if any.
- (b) Attachment of a resolution by the local governing body formally approving the waterfront program and its transmittal to the Secretary of State for approval.
- (c) Evidence of local support by both public and private agencies and general citizenry, including information on public meetings held for the purpose of informing residents of the proposals. Such evidence can be in the form of letters and/or resolutions by such groups as businessmen's associations, citizen improvement groups, and environmental groups affected. It is important that a local program have broad support from both development and preservation interests. Formation of a citizen's advisory committee can often be an effective means of gaining public support for a local program.
- (d) Identification of objections to the proposal, including any letters or resolutions received in opposition.

While a local commitment is obtained only near the end of the process, the effort to obtain such commitment must begin at the inception of the development of the program.

7. *Consultation with Other Affected Governments*

Each locality wishing to prepare a local program is strongly encouraged to consult with adjacent coastal communities and its county on their plans and policies for the coastal area. To assure a useful exchange of ideas this should be done early in program development. The DOS will assist any community in this effort if requested.

DIRECTIONS FOR SUBMISSION OF A PROGRAM

There are two stages to the completion and submission of a local Waterfront Revitalization Program:

1. *Draft Program Document.*

The required content of the local program was covered in the previous section. Once the first five of these items have been completed, 30 copies of the proposed program should be forwarded to the Department of State for initial review by the state agencies which may be concerned. Copies should also be provided to county and regional planning agencies and to adjacent coastal communities. The implementation section at this time may be proposals rather than finally enacted laws or ordinances, but the method of implementation must be made clear. The Local Commitment section need not be attached to this draft.

The draft document must include maps at any appropriate scale which clearly identify the proposed program items. A summary map should also be prepared at a scale of 1:24,000. Items to be entered on these maps or map are:

- boundary of the state coastal area
- inventory information prepared as part of the local program
- specific land and water uses and locations of projects proposed for the waterfront area.

Copies of local legislation to be used to implement the program should be included if already enacted. A draft Environmental Impact Statement may also be required.

2. *Final Program Document*

After receiving Department of State clearance of the draft program, the final document should be submitted, again in 35 copies. The following additional items must be part of the final submission:

- any amendments or alterations required following Department of State review of the draft version
- copies of enacted ordinances or local laws to be employed in carrying out the program (or a proposed local law or ordinance to be enacted upon program approval. Programs may be approved conditional on such enactment.)
- evidence of formal approval of the program by the local legislative body, and executive
- evidence of local support of the program
- identification of objections to the program, including any letters or resolutions received.

BENEFITS OF AN APPROVED LOCAL PROGRAM

Consistency

One of the major benefits and innovations of the Waterfront Revitalization of Coastal Areas and Inland Waterways law is the concept of “consistency.” This provision aims to raise the goal of coordination between local government and the State and federal governments to a new level and at the same time provides the means to make it a reality. The premise behind the concept is as follows: if a locality develops a detailed Waterfront Revitalization Program which furthers the State’s general coastal policies (and is not in conflict with other established state policy), then the State should adhere to the details of that program.

(i.e., the State will not attempt to ‘second guess’ what is the best way to implement a particular policy at the local level). The process of program approval is to provide the State with an adequate opportunity to determine that a local program furthers the State coastal policies and does not conflict with other established State policies.

The ‘Consistency’ provision will work as follows:

1. During the development of its local Waterfront Revitalization Program, a locality is encouraged to consult with State and federal agencies concerning aspects of mutual interests. The Department of State staff is available to facilitate such consultation.
2. Before approving a local Waterfront Revitalization Program, the Secretary of State will consult with potentially affected State and federal agencies. These agencies will have 60 days in which to comment on a local program. The Secretary will not approve a local Waterfront Revitalization Program if he/she finds it conflicts with an existing State or federal policy. When a conflict is found, the Secretary will attempt to resolve the differences. Prior to approving the program the Secretary must also find that the program is consistent with the policies and purposes of Article 42 and incorporates certain required activities. Upon receiving the draft program the Secretary will provide State and federal agencies likely to be affected by the program with copies. The following State and federal agencies are the ones most likely to receive copies:
 - U.S. Department of Commerce - National Oceanographic and Atmospheric Agency
 - U.S. Environmental Protection Agency
 - U.S. Department of Interior - National Park Service and Bureau of Fish and Wildlife
 - U.S. Department of Transportation - U.S. Coast Guard
 - U.S. Department of Defense - Army Corps of Engineers
 - Federal Emergency Management Administration
 - U.S. Department of Housing and Urban Development
 - NYS Department of Environmental Conservation
 - NYS Office of Parks, Recreation, and Historic Preservation
 - NYS Department of Transportation
 - NYS Department of Commerce
 - New York State Energy Research and Development Authority (NYSERDA)
 - NYS Department of Public Service
 - NYS Office of General Services
 - Port Authorities, if located in that community

Other State and federal agencies will be sent copies of the draft program if the program has identified any actions of these agencies as necessary for successful implementation of the local program or if the Secretary finds that their programs may be significantly affected by the program.

3. Within sixty days of approving a local program, the Secretary will identify specific State permit, financial assistance, acquisition, and capital construction programs likely to affect the achievement of the local program. This identification will be based on the identification of State programs by the locality in its program, additional consultation with the locality and State agencies if necessary, and the DOS familiarity with State programs that affect the coastal area.

4. State agency programs so identified will, to the maximum extent practicable, be undertaken in a manner consistent with the approved local Waterfront Revitalization Program. Amendments to SEQR regulations in tandem with new DOS regulations will provide the procedures for the State agency's consistency determination. Using the Environmental Notice Bulletin, A-95 and other procedures if necessary, State agencies will provide local government with adequate information on a proposed action. The municipality is expected to evaluate proposed actions and identify any conflicts with its approved local program. Once notified by the locality of the potential conflicts, the Secretary will confer with the State agency and the local government to modify the action so that it will be consistent with the approved Waterfront Revitalization Program.
5. The Secretary is also required by the Act to work with State agencies and seek additional means of implementing approved local waterfront programs. Where a local government has identified program elements which depend upon other than local funds and actions, the Secretary will consult with the appropriate State and federal agencies to explore the possibilities or programming of additional assistance that would further the implementation of the local program.

Project Funding

Financial assistance is provided to a local government for implementation of a local Waterfront Revitalization Program. Grants for activities, including eligible preconstruction activities (feasibility studies, preliminary engineering studies) which implement an approved LWRP will be made to a local government or a local government agency provided: (1) the proposed project will lead to the achievement of state and local policies identified for priority attention, (2) if the funding is to be used for preconstruction activities, the grant does not exceed 10% of the cost of the construction projects, and (3) if the grant is to be used for preliminary engineering reports, funds are committed for completion of the construction project. Additionally, whether and to what extent a locality will receive financial assistance will be based on criteria which reflect the following considerations:

The allocation of funds to local governments for the implementation of Waterfront Revitalization Programs will reflect their initiative and interest in undertaking these tasks and other factors to assure fair and equitable distribution. Determination of what constitutes "initiative and interest" and "fair and equitable" will be based on consideration of the following points:

- The initiative shown by the locality by its commitment of local resources (fiscal and non-fiscal) to the implementation of its approved program.
- The significance of the coastal resource/activity affected by the implementation project for the locality, the region, or the State.
- The number of people benefiting from the project, and the population of coastal locality, or coastal areas as appropriate.
- The likelihood that the project being facilitated will be successfully implemented.
- The degree to which the project furthers State and federal priorities.
- The ability of the locality to undertake the work without a grant.

Technical Assistance

The Department of State is able to offer technical assistance to localities in the preparation of waterfront revitalization programs. A staff of coastal specialists will be on hand to answer questions, suggest approaches, and provide needed services such as making available maps and data helpful in preparing a local program.

PART II – SPECIFIC GUIDELINES

INTRODUCTION

Each community wishing to have an approved LWRP must, according to Article 42 of the Executive Law, further and incorporate certain policies and activities in its local program to an extent commensurate with local circumstances. The following policies and activities are those that must be addressed. For each policy or activity, guidelines are provided for: 1) determining the degree to which the policy applies to each locality; 2) identifying the techniques available and suitable for implementing the policy; and 3) determining whether a community's treatment of the policy is adequate.

POLICIES

Deteriorated and Underutilized Urban Waterfront Areas

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy “to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources... (Section 912.1) and “to encourage the restoration and revitalization of...[human-made] resources” (Section 912.6). The law also declares that a LWRP should incorporate the promotion and preservation of scenic, historic, and cultural resources as community amenities and tourist destinations, and “the reuse of existing infrastructure and building stock and the removal of deteriorated structures and unsightly conditions....” Therefore, DOS regulations require that to be approved, a LWRP must further the following policy: “*RESTORE, REVITALIZE, AND REDEVELOP DETERIORATED AND UNDERUTILIZED WATERFRONT AREAS FOR BUSINESS, CULTURAL, RECREATIONAL AND OTHER COMPATIBLE USES.*”

Revitalization of their once dynamic waterfront areas is one of the most effective means of encouraging economic growth, without consuming valuable open space outside of these waterfront areas. Waterfront redevelopment is also one of the most effective means of rejuvenating or at least stabilizing residential and commercial districts adjacent to the redevelopment area.

Communities affected by this policy should also refer to the policy guidelines below on: Water Dependent Uses; Concentration of Development; and Expediting Permit Procedures.

I. Determining the degree to which this policy applies to each locality

This policy is directed at communities where the effects of a steady exodus of people, commerce and industry, has resulted in underutilized, abandoned and often deteriorated waterfront sites. In determining whether this policy applies to a particular locale, reliance will be placed on information obtained from the waterfront resource inventory which each community is required to produce for its Waterfront Revitalization Program. In some larger coastal communities, there should be no uncertainty as to its application; in small communities, it will be a matter of judgment, on a use-by-use basis.

II. *Identifying the techniques available and suitable for implementing this policy*

Most communities will find that, among the many policies which they may have to deal with in preparing Waterfront Revitalization Programs, this policy probably will require the most vigorous and imaginative deployment of the powerful tools at their disposal: legal, financial and political.

Implementation also will require the full commitment of the community's leaders and its residents, as well as the closest working relationship with other government agencies and private interests.

While implementation of such major development will depend heavily on private investment, attracting private investment will require the imaginative use of all of a community's legal and financial tools including: zoning techniques such as the creation of special waterfront districts; site plan reviews; permit procedures; building codes; the use of eminent domain powers; tax incentives; special benefit assessments or improvement districts; and capital facilities programming.

III. *Determining whether a community's treatment of this policy is adequate*

DOS recognizes that implementation of this policy is a long term project. Thus, a community's treatment of it will be reviewed in that context.

- A. Because some communities will find significant levels of complexity of ownership, use and structural conditions in their waterfront redevelopment areas, they should first prepare a set of data, including maps, sufficiently detailed to give precise information, on the current status of those areas. Without those data, redevelopment planning efforts would be fruitless.
- B. The community should demonstrate that it has established, or will establish within a reasonable time, appropriate laws, ordinances or governmental initiatives in regard to waterfront redevelopment areas, in which direction and incentive is given to ensure that, where pertinent:
 1. Priority is given to uses which are dependent on a location adjacent to the water;
 2. Proposed actions will enhance existing and anticipated uses;
 3. Proposed actions will serve as a catalyst to private investment in these areas;
 4. Proposed actions will improve the deteriorated condition of a site, and at a minimum, must not cause further deterioration;
 5. Proposed actions will lead to development which is compatible with the existing or planned character of the areas, with consideration given to scale, architectural style, density and intensity of use;
 6. Proposed actions will have the potential to improve the existing economic base of the community and, at a minimum, not jeopardize this base;
 7. Proposed actions will improve adjacent and upland views of the water, and, at a minimum, not affect these views in an insensitive manner;
 8. Proposed actions will improve the potential for multiple uses of the site.

Water Dependent Uses

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that a local waterfront revitalization program must incorporate “the facilitation of appropriate industrial and commercial uses which require or can benefit substantially from a waterfront location such as but not limited to waterborne transportation facilities and services, and support facilities for commercial fishing and aquaculture” (Section 915.5.a.). Therefore, DOS regulations require that to be approved, a LWRP must “*FACILITATE THE SITING OF WATER DEPENDENT USES AND FACILITIES ON OR ADJACENT TO COASTAL WATERS.*”

There is a finite amount of waterfront space suitable for development purposes. Consequently, while the demand for any given piece of property will fluctuate in response to varying economic and social conditions, on a statewide basis the only reasonable expectation is that long-term demand for waterfront space will intensify.

The traditional method of land allocation, i.e., the real estate market, with or without local land use controls, offers little assurance that uses which require waterfront sites will, in fact, have access to coastal waters. To ensure that such “water dependent” uses can continue to be accommodated, a community should avoid undertaking, funding, or approving non-water dependent uses when such uses would preempt the reasonably foreseeable development of water dependent uses, and should utilize appropriate programs to encourage water dependent activities.

I. Determining the degree to which this policy applies to each locality

Rural coastal communities will be the least affected by this policy although their desire to prepare a local Waterfront Revitalization Program probably reflects a certain degree of pressure on their shorefronts. The greatest need for this policy will be found in locales in or near population centers, where the competition for waterfront land is usually more intense. The water dependency concept, however, is so fundamental to the proper management of waterfront resources that most communities will respond to this policy in their programs.

II. Identifying the techniques available and suitable for implementing this policy

Because “water dependency” is a comparatively new approach to meeting development needs, the processes and techniques for implementing it are described here in great detail.

Water Dependent Uses and Facilities

The uses and facilities are considered as water dependent:

1. Uses which depend on the utilization of resources found in coastal waters (for example: fishing, mining of sand and gravel, mariculture activities);
2. Recreational activities which depend on access to coastal waters (for example: swimming, fishing, and boating);
3. Uses involved in the sea/land transfer of goods (for example: docks, loading areas, pipelines, short-term storage facilities);
4. Structures needed for navigational purposes (for example: locks, dams, lighthouses);
5. Flood and erosion protection structures (for example: breakwaters, bulkheads);

6. Facilities needed to store and service boats and ships (for example: marinas, boat repair, boat construction yards);
7. Uses requiring large quantities of water for processing and cooling purposes (for example: hydroelectric power plants, fish processing plants, pumped storage power plants);
8. Uses that rely heavily on the waterborne transportation of raw materials or products which are difficult to transport on land, thereby making it critical that a site near to shipping facilities be obtained (for example: fuel export facilities, cement plants, quarries);
9. Uses which operate under such severe time constraints that proximity to shipping facilities becomes critical (for example: firms processing perishable foods);
10. Scientific/educational activities which, by their nature, require access to coastal waters (for example: certain meteorological and oceanographic activities); and
11. Support facilities which are necessary for the successful functioning of permitted water dependent uses (for example: parking lots, snack bars, first-aid stations, short-term storage facilities). Though these uses must be near the given water dependent use they should, as much as possible, be sited inland from the water dependent use rather than on the shore.

Water-enhanced Uses

In addition to water dependent uses, uses which are enhanced by a waterfront location should be encouraged to locate along the shore, though not at the expense of water dependent uses. A water-enhanced use is defined as a use that has no critical dependence on obtaining a waterfront location, but the profitability of the use and/or the enjoyment level of the users would be increased significantly if the use were adjacent to, or had visual access to, the waterfront. A restaurant which uses good site design to take advantage of a waterfront view, and a golf course which incorporates the coastline into the course design, are two examples of water-enhanced uses.

“Temporary” Non-Water Dependent Uses

If there is no immediate demand for a water dependent use in a given area but a future demand is reasonably foreseeable, temporary non-water dependent uses should be considered preferable to a non-water dependent use which involves an irreversible, or nearly irreversible commitment of land. Parking lots, passive recreational facilities, outdoor storage areas, and non-permanent structures are uses or facilities which would likely be considered as “temporary” non-water dependent uses.

Choice of Sites

In the actual choice of sites where water dependent uses will be encouraged and facilitated, the following factors should be considered:

1. Consistency with other coastal policies - the designation of a site as appropriate for water dependent uses will have to be consistent with other policies. Particularly relevant would be those policies calling for development where environmental conditions are favorable, and where the concentration of development would be reinforced. The siting of water dependent uses would also have to comply with all policies relating to specific coastal resources - the existence of wetlands, fish and wildlife habitats, important agricultural

lands, and beaches and other erosion and flood hazard areas, would therefore have to be taken into consideration.

2. Competition for space - competition for space or the potential for it, should be indicated before any given site is promoted for water dependent uses. The intent is to match water dependent uses with suitable locations and thereby reduce any conflicts between competing uses that might arise. Not just any site suitable for development should be chosen as a water dependent use area. The choice of a site should be made with some meaningful impact on the real estate market anticipated. The anticipated impact could either be one of increased protection to existing water dependent, activities or else the encouragement of water dependent development.
3. In-place facilities and services - most water dependent uses, if they are to function effectively, will require basic public facilities and services. In selecting appropriate areas for water dependent uses, consideration should be given to the following factors:
 - a) The availability of public sewers, public water lines and adequate power supply;
 - b) Access to the area for trucks and rail, if heavy industry is to be accommodated; and
 - c) Access to public transportation, if a high number of person trips is to be generated.
4. Access to navigational channels - if commercial shipping, commercial fishing, or recreational boating are planned, the locality should consider setting aside a site, within a sheltered harbor, from which access to adequately sized navigation channels would be assured.
5. Compatibility with adjacent uses - water dependent uses should be located so that they enhance, or at least do not detract from, the surrounding community. Considerations such as the protection of nearby residential areas from odors, noise and traffic should be made. Affirmative approaches should also be employed so that water dependent uses and adjacent uses can serve to complement one another. For example, a recreation-oriented water dependent use area could be sited in an area already oriented towards tourism. Clearly, a marina, fishing pier or swimming area would enhance, and in turn be enhanced by, nearby restaurants, motels and other non-water oriented tourist activities.
6. Preference to underutilized sites - the promotion of water dependent uses should serve to foster development as a result of the capital programming, permit expediting, and State and other local actions that will be used to promote the site. Nowhere is such a stimulus needed more than in those portions of the State's waterfront areas which are currently underutilized.
7. Providing for expansion - a primary objective of the policy is to create a process by which water dependent uses can be accommodated well into the future. Localities should therefore give consideration to long-term space needs and, where practicable, accommodate future demand by identifying more land than is needed in the near future.

Promoting Water Dependent Use Areas

In promoting water dependent uses, the following kinds of actions should be considered:

1. Favored treatment to water dependent use areas with respect to capital programming. Particular priority should be given to the construction and maintenance of port facilities, roads, railroad facilities, and public transportation within areas suitable for water dependent uses.
2. When areas suitable for water dependent uses are publicly owned, favored leasing arrangements could be given to water dependent uses.
3. Where possible, consideration might be given to providing water dependent uses with property tax abatements, loan guarantees, or loans at below market rates.
4. Local planning and economic development agencies should actively promote water dependent uses. In addition, a list of sites available for non-water dependent uses should be maintained in order to assist developers seeking alternative sites for their proposed projects.
5. Local, state and federal agencies should work together to streamline permitting procedures that may be burden-some to water dependent uses. This effort should begin for specific uses in a particular area.
6. Local land use controls, especially the use of zoning districts exclusively for waterfront uses, can be an effective tool of local government in assuring adequate space for the development of water dependent uses.

III. *Determining whether a community's treatment of this policy is adequate*

Although the techniques for dealing with this policy are set forth in very specific details above, the newness of the process requires adoption of a flexible approach to evaluation of a community's treatment. Nevertheless, certain key elements described must be addressed:

- (1) Identify Water/ dependent, Water Enhanced, and "Temporary" Non-water Dependent Uses which are appropriate to the community's present stage of development;
- (2) Prepare a projection of possible future demands by those and anticipated new water dependent uses and facilities;
- (3) If necessary, select sites where water dependent uses will be encouraged and facilitated;
- (4) Establish laws or ordinances to promote and to safeguard those sites as locations for water dependent uses and facilities.

Concentration of Development

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is state policy "to encourage the location of land development in areas where infrastructure and public services are adequate" (Section 912.7) and that LWRPs incorporate the "reuse of existing infrastructure and building stock..." Therefore, DOS regulations require that to be approved, a LWRP must "*ENCOURAGE THE LOCATION OF DEVELOPMENT IN AREAS WHERE PUBLIC SERVICES AND FACILITIES ESSENTIAL TO SUCH DEVELOPMENT ARE ADEQUATE, EXCEPT WHEN SUCH DEVELOPMENT HAS SPECIAL FUNCTIONAL REQUIREMENTS OR OTHER CHARACTERISTICS WHICH NECESSITATE ITS LOCATION IN OTHER COASTAL AREAS*".

By its construction, taxing, funding and regulatory powers, government has become a dominant force in shaping the course of development. Through these government actions, large scale development in the coastal area will be encouraged to locate within, contiguous to, or in close proximity to existing areas of

concentrated development where infrastructure and public services are adequate, where topography, geology, and other environmental conditions are suitable for and able to accommodate development, and where development will not have significant adverse effects on the achievement of other coastal policies.

The above policy is intended to accomplish the following:

- strengthen existing residential, industrial, and commercial centers
- foster an orderly pattern of growth where outward expansion is occurring
- increase the productivity of existing public services and moderate the need to provide new public services in outlying areas
- preserve open space in sufficient amounts and where desirable
- foster energy conservation by encouraging proximity between home, work, and leisure activities

I. Determining the degree to which this policy applies to each locality

This policy applies to every community.

II. Identifying the techniques available and suitable for implementing this policy

The first step a community should take in implementing this policy is to analyze its waterfront area. This is necessary because, for any action that would result in large scale land development or an action which would facilitate or serve future large scale land development, the community should make a determination as to whether or not the proposed action is within, contiguous to, or in close proximity to an area of concentrated development where infrastructure and public services are adequate.

Communities should use the following guidelines in analyzing their waterfront areas and in making that determination.

1. Cities, built-up suburban towns and villages, and rural villages in the coastal area are generally areas of concentrated development where infrastructure and public services are adequate.
2. Other locations in the coastal area may also be suitable for such land development, if three or more of the following conditions prevail:
 - a. Population density of the area surrounding or adjacent to the proposed site exceeds 1,000 persons per square mile;
 - b. Less than 50% of the buildable sites (i.e., sites meeting lot area requirements under existing local zoning regulations) within one mile radius of the proposed site are vacant;
 - c. Proposed site is served by or is near to public or private sewer and water lines;
 - d. Public transportation service is available within one mile of the proposed site; and
 - e. A significant concentration of commercial and/or industrial activity is within one-half mile of the proposed site.
3. The following points shall be considered in assessing the adequacy of an area's infrastructure and public services:

- a. Streets and highways serving the proposed site can safely accommodate the peak traffic generated by the proposed land development;
- b. Development's water needs (consumptive and firefighting) can be met by the existing water supply system;
- c. Sewage disposal system can accommodate the wastes generated by the development;
- d. Energy needs of the proposed land development can be accommodated by existing utility systems;
- e. Stormwater runoff from the proposed site can be accommodated by on-site and/or off-site facilities, and
- f. Schools, police and fire protection, and health and social services are adequate to meet the needs of the population expected to live, work, shop, or conduct business in the area as a result of the development.

Exceptions are made in recognition that certain forms of land development may and/or should occur at locations which are not within or near areas of concentrated development. Thus, this coastal development policy does not apply to the following types of land development projects and activities:

1. Economic activities which depend upon sites at or near locations where natural resources are present, e.g., lumber industry, quarries.
2. Land development which by its nature is enhanced by a non-urbanized setting, e.g., a resort complex, campgrounds, second home developments.
3. Land development which is designed to be a self-contained activity, e.g., a small college, an academic or religious retreat.
4. Water dependent uses.
5. Land development which because of its isolated location and small-scale has little or no potential to generate and/or encourage further land development.
6. Uses and/or activities which because of public safety considerations should be located away from populous areas.
7. Rehabilitation or restoration of existing structures and facilities.
8. Land development projects which are essential to the construction and/or operation of the above uses and activities.

Because this policy explicitly requires a positive approach to land use by "encouraging" concentration of development, the techniques used to implement it should be so constructed. That is, communities should use incentives and disincentives to attract appropriate development to the areas identified above. Zoning ordinances, permits, site pre-clearing, capital budgets and other similar techniques can be used to achieve that goal.

III. Determining whether a community's treatment of this policy is adequate

A community which has identified areas meeting the criteria listed in II above and which can demonstrate that it has established or will establish a reasonable incentive/disincentive mechanism so as to encourage development in such areas should be deemed to have met the requirements of the policy.

Major Ports

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy “to encourage the development and use of existing ports...so as to reinforce their roles as valuable components within the State’s transportation and industrial network” and that LWRPs provide for the “strengthening of the economic position of the state’s major ports” (Section 912.2). Therefore, DOS regulations require that affected localities in their LWRPs “*ENCOURAGE THE DEVELOPMENT OF THE STATE’S EXISTING PORTS OF ALBANY, BUFFALO, NEW YORK, OGDENSBURG AND OSWEGO AS CENTERS OF COMMERCE AND INDUSTRY, AND ENCOURAGE THE SITING, IN THESE PORT AREAS, INCLUDING THOSE UNDER THE JURISDICTION OF STATE PUBLIC AUTHORITIES OF LAND USE AND DEVELOPMENT WHICH IS ESSENTIAL TO OR IN SUPPORT OF WATERBORNE TRANSPORTATION OF CARGO AND PEOPLE.*”

The general approach which communities should adopt to meet the requirements of this policy is one which recognizes the importance of port operations by, at a minimum accommodating them, and as far as possible stimulating them, so that they may continue to contribute to the economic wellbeing of the locale and of the State.

I. Determining the degree to which this policy applies to each locality

The aim of this policy is to promote the development of the State’s major ports: New York, Buffalo, Oswego, Ogdensburg and Albany. Thus, with the exception of the discussion below on proposals for new major ports, only communities whose actions might affect those five ports need observe this guidelines section. Those communities should also refer to the guidelines on Water Dependency, Concentration of Development, and Expediting of Permit Reviews, all of which have significant implications for port development.

II. Identifying the techniques available and suitable for implementing this policy

Before addressing discrete techniques for implementing these guidelines, a major port community should ask if it has established an effective means of coordination with port agencies, owners and operators so that implementation of the policy is carried out in an informed way rather than reactively. For example, port operations have been viewed as such an integral part of its overall waterfront activities that the City of Buffalo has joined recently with the Niagara Frontier Transportation Authority and other public and private interests to form a Waterfront Planning Board to help determine the future of that city’s waterfront. Formal structures such as Buffalo have established may not be necessary in all communities but the principle is worth considering.

Implementation of this policy may be achieved by exercise of the community’s police powers including zoning, building codes and other permit procedures, and planning functions, and through its capital budget to assure compatible development in areas adjacent to ports.

III. Determining whether a community’s treatment of this policy is adequate

First, a distinction must be made between public and private port operations. All five ports have facilities operated by public agencies established by the State legislature such as the Albany Port

District Commission and the Niagara Frontier Transportation Authority. The special character of those agencies is noted below.

DOS recognizes that jurisdictional constraints may prevent communities from implementing certain of the guidelines presented below.

- A. In regard to both public and private port areas, a community's treatment of this policy will be considered adequate if it can demonstrate in its decisions:
 - (1) In evaluating and acting upon proposed projects within or abutting port areas, the overriding consideration is the maintenance and enhancement of essential port activity which will have precedence over other non-port related activities.
 - (2) Dredging to maintain the economic viability of the port will be considered an action of major state or regional benefit if need is shown and it can be demonstrated that environmental impacts would be at an acceptable level.
 - (3) Landfill projects for port related activities in near-shore areas will be regarded as an acceptable activity within port areas provided adverse environmental impacts are minimized and strong economic justification is demonstrated.
 - (4) Non-port related activities proposed to be located in or near a port area will be sited so that they will not interfere with normal port operations.
 - (5) In the programming of capital projects affecting ports, high priority will be given to those that promote the development and use of the port.
- B. Two additional guidelines are directed at the community's treatment of public port agencies. First, when not already restricted by existing laws or covenants, and when there is no major public benefit to doing otherwise, surplus public land or facilities should be offered for sale, in the first instance, to the local public port agency. Second, particularly where there is limited access to the waterfront, the community should negotiate with the public port agency to provide opportunities for public access insofar as this does not interfere with the day-to-day operations of the port and its tenants do not incur unreasonable cost.
- C. Commercial shipping may be hindered or damaged by floating debris in the ports' waterways. Because the major source of this hazard is deteriorating waterfront buildings, piers, barges and other vessels, the community should enact laws or ordinances which would ensure the upkeep of those structures and vessels and prevent their abandonment.
- D. All coastal communities should be aware that any proposals in their LWRPs for the development of new major ports will be assessed in terms of the anticipated impacts on: (a) existing New York State major ports; (b) existing modes of transportation; and (c) the surrounding land uses and overall neighborhood character in the area in which the proposed port is to be located.

Smaller Harbors

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy "to encourage the development and use of small harbors including use and maintenance of viable existing infrastructures" (Section 912.2), and that LWRPs incorporate means for "strengthening the economic

position of... small harbors”(Section 915.5.d). Therefore, DOS regulations require that to be approved a LWRP “*STRENGTHEN THE ECONOMIC BASE OF SMALLER HARBOR AREAS BY ENCOURAGING THE DEVELOPMENT AND ENHANCEMENT OF THOSE TRADITIONAL USES AND ACTIVITIES WHICH HAVE PROVIDED SUCH AREAS WITH A UNIQUE MARITIME IDENTITY.*”

This policy recognizes that the traditional activities occurring in and around many smaller harbors throughout the State’s coastal area have contributed much to the economic strength and attractiveness of harbor communities. However, in many instances, sight has been lost of these values. Thus, community efforts should center on promoting and facilitating such desirable activities as recreational and commercial fishing, ferry services, marinas, historic preservation, cultural pursuits, and other compatible activities which have made those smaller harbor areas appealing as tourist destinations and commercial and residential areas. Particular consideration shall be given to the visual appeal and social benefits of smaller harbors which, in turn, can make significant contributions to the State’s tourism industry.

I. Determining the degree to which this policy applies to each locality

Many locales will have no difficulty in identifying themselves as communities with smaller harbors as for example, Greenport and Freeport on Long Island. Some will be more substantial than others. In general, however, this policy applies to communities with a rich mix of active traditional uses such as commercial fishing, recreational boating and fishing, boat building and repair, and a resource base of natural amenities and historic buildings. Competition is keen for waterfront space in those communities and time-honored activities are threatened with displacement by new uses, many of which are incompatible with the harbor’s distinctive character.

II. Identifying the techniques available and suitable for implementing this policy

The most important tools available to small harbor communities are, of course, those delegated to them under the police powers. Imaginative use of zoning to create commercial marine districts, to restrict building heights, and to set design standards, for example, will help achieve the purposes of the guidelines. Some communities may decide to establish harbor improvement districts where agreement can be reached among private and public interests to share the cost of necessary upgrading of amenities.

III. Determining whether a community’s treatment of this policy is adequate

In developing its local waterfront revitalization program, a community will have a wide range of methods to develop or enhance its small harbor area. The adequacy of the approaches it chooses will be ascertained by evaluating how it proposes to achieve the following:

- (A) Give priority to those traditional or desired uses which are dependent on or enhanced by a location adjacent to the water.
- (B) Ensure that proposed activities will enhance or not detract from or adversely affect existing traditional and/or desired anticipated uses.
- (C) Ensure that proposed activities will not be out of character with, nor lead to development which would be out of character with, existing development in terms of the area’s scale, intensity of use, and architectural style.
- (D) Ensure that harbor area structures are not abandoned or allowed to deteriorate.

- (E) Ensure that proposed actions will not adversely affect the existing economic base of the community, e.g., waterfront development revolving around a residential complex might be inappropriate in a harbor area where the economy is dependent on tourism and commercial fishing.
- (F) Ensure that proposed activities will not detract from views of the water and the harbor area, particularly where the visual quality of the area is an important component of the area’s appeal and identity.

Permit Simplification

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that a local waterfront revitalization program must incorporate “means for long-term management and maintenance of waterfront development and activities, including organizational structures and responsibilities and appropriate land use controls (Section 915.4.e). As part of this requirement, LWRPs should take steps to expedite existing permit procedures in order to facilitate the siting of development activities at suitable locations.

I. Determining the degree to which this policy applies to each locality

This policy applies to every coastal community seeking approval of a LWRP.

II. Identifying the techniques available and suitable for implementing this policy

To meet this requirement, a local government should determine if existing controls can be simplified in an effort to expedite desired development in areas suitable for such development. Further, the local government must identify those State and federal permit programs requiring simplification in order to expedite the desired development (Section 915(5) (h)).

For specific types of development activities and in areas suitable for such development, state agencies and local governments participating in the Waterfront Revitalization Program, should, to the maximum extent practicable, coordinate and synchronize existing permit procedures and regulatory programs, as long as the integrity of the regulations’ objectives is not jeopardized. These procedures and programs should be coordinated within each agency. Also, efforts should be made to ensure that each agency’s procedures and programs are synchronized with other agencies’ procedures at each level of government. Finally, regulatory programs and procedures should be coordinated and synchronized between levels of government, and if necessary, legislative and/or programmatic changes recommended.

When proposing new regulations, local government should determine the feasibility of incorporating the regulations within existing procedures, if this reduces the burden on a particular type of development and will not jeopardize the integrity of the regulations’ objectives.

Permit simplification techniques range from simple redesign of a form to revamping of a complex review process. For example, the Department of Environmental Conservation and the Corps of Engineers, Buffalo District, now share the same application form for certain permits, thus reducing the public’s paperwork load. The pre-clearing of sites suitable for development is another approach which a community may choose. “One-stop shopping” and systems for keeping track of permit applications are other examples.

Preparation of a guide to development permits could be a most productive initial step: it would not only give assistance to developers and the public at large but also provide a preliminary basis for the community to review the permit process as a whole.

Local governments should note that the Waterfront Revitalization of Coastal Areas and Inland Waterways law requires a local program to be approved by its legislative body. This approval will require local regulatory agencies to adhere to the program policies, which, if the program is approved by the Secretary of State, will be adhered to by State and federal agencies. This adherence to one set of specific policies will provide the basis for improving the ease of obtaining permits. This requirement, in conjunction with the requirement for all interests to be consulted during the program's preparation (Section 915(3)), lessens the time necessary for public review of individual actions when proposed, thus providing another means for expediting permits.

In addition, Section 916(1) (b) of the law requires State agencies' actions to be consistent to the maximum extent practicable with approved local programs. Because local programs are, in part, a detailing of State policies, this will significantly increase the specificity of State policies, decrease the discretionary power of the regulator, increase the developer's understanding of approval conditions and provide a mechanism for expediting permits.

III. Determining whether a community's treatment of this policy is adequate

DOS recognizes that permit simplification will not be achieved overnight. However, a community should at a minimum demonstrate that a review of local permit processes is underway. Recognition may also be given to earlier community improvements made in this policy area.

Significant Fish and Wildlife Habitats

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy "to conserve and protect fish and wildlife habitats identified by the Department of Environmental Conservation as critical to the maintenance or reestablishment of species or wildlife. Such protection shall include mitigation of the potential impact from adjacent land use or development" (Section 912.3). This policy recognizes that valuable fish and wildlife species cannot be protected and maintained without preserving their habitats. DOS regulations require that to be approved a LWRP must further the following policy: "*SIGNIFICANT COASTAL FISH AND WILDLIFE HABITATS, AS IDENTIFIED ON THE COASTAL AREA MAP, SHALL BE PROTECTED AND PRESERVED SO AS TO MAINTAIN THEIR VIABILITY AS HABITATS.*"

A habitat is an area with a unique combination of resources (food, shelter, living space, etc.) and environmental conditions (temperature, climate, salinity, etc.) which animals need for their survival. When humans destroy a vital resource or alter an environmental condition beyond an organism's range of tolerance, we destroy the habitat.

Certain habitats, such as breeding grounds, nursery areas, and migratory routes, are special areas where fish and wildlife populations tend to congregate during various stages of their life cycle. Such areas must be identified and afforded special protection, since their loss would create a greater threat to the survival of a population than would the loss of areas where the organisms were less densely distributed.

While habitat protection is recognized as fundamental to assuring the survival of fish and wildlife populations, certain habitats are more critical to the maintenance of a given population than others and

therefore merit a greater degree of protection. Such habitats exhibit one or more of the following characteristics:

1. are essential to the survival of a large portion of a particular fish or wildlife population (e.g., feeding groups, nursery areas);
2. support populations of rare and endangered species;
3. are found at a very low frequency within a coastal region;
4. support fish and wildlife populations having significant commercial and/or recreational value; and,
5. would be difficult or impossible to replace.

In cooperation with the State's Coastal Management Program, the Department of Environmental Conservation has identified coastal fish and wildlife habitats. Their relative importance is being evaluated according to a system which DOS and DEC have developed. This system incorporates the above five parameters.⁷³ Results of the evaluation will provide the basis for determining whether a habitat should or should not be designated a "significant habitat."

Once a habitat area is identified as significant, it will be mapped on the official New York Coastal Area Map. A narrative will be prepared detailing information on that particular habitat, e.g., description of the community of organisms and a list of the types of actions that most likely would affect the habitat.

I. Determining the degree to which this policy applies to each locality

To determine whether a community must respond to this policy, it must simply consult the N.Y.S. Coastal Area Map to see if one or more significant habitats are located within or near the proposed boundaries of its local waterfront revitalization program.

If a community recognizes an additional habitat which it considers important enough to warrant designation as a significant coastal habitat, then it should recommend in its LWRP to the Department of State that the habitat area be considered for such designation. The Department will, in turn, instruct the Department of Environmental Conservation to field check the area and apply the rating system to determine its relative significance.

II. Identifying the techniques available and suitable for implementing this policy

The techniques available and suitable for implementing this policy will be a function of the type of significant habitat requiring protection, and the degree of protection already being afforded to that area through existing regulatory programs.

In most cases, when a local response is needed it will probably have to be a regulatory one. For example, municipalities may enact zoning provisions aimed at protecting identified habitat areas, such as open space requirements, prohibition of the removal of soil and vegetative cover essential to habitats, and regulations on the use and siting of buildings or activities which may have an adverse effect on nearby habitats or fish and wildlife resources.

Municipalities may adopt programs, where feasible, that permit an owner of land including or adjoining a habitat to transfer the development rights of the parcel to another parcel in the locality.

As part of local subdivision regulations, a developer may be required to employ the cluster design technique if his land includes or is adjacent to a significant fish or wildlife habitat. This approach would

permit the developer to locate future residential construction away from an identified habitat, thereby reducing adverse effects.

As an alternative to a regulatory approach, a locality could acquire fee or less than fee interests in land for the protection of critical fish and wildlife habitats.

III. Determining whether a community’s treatment of this policy is adequate

A locality’s treatment of this policy will be considered adequate if it:

- (1) has recognized the existence of any significant habitat(s) located within or near its program boundary;
- (2) described the habitat in a level of detail commensurate with that of the existing information on the particular habitat available at the Department of Environmental Conservation;
- (3) listed existing State regulatory programs already affording protection to the significant habitat (e.g. Freshwater or Tidal Wetlands Act);
- (4) identified a need, if any, for additional local regulatory controls to preserve the habitat and proposed a means of implementing such controls;
- (5) identified likely adverse impacts associated with any of the proposed activities identified in their LWRP, and
- (6) identified and planned for the mitigation of these adverse impacts to acceptable levels.

The LWRP should ensure that land and water uses or development would not be undertaken or approved if such actions would destroy or significantly impair the viability of an area designated as a significant coastal fish and wildlife habitat. When the action would cause the elimination of a vital resource (e.g., food, shelter, living space) or a change in environmental conditions (e.g., temperature, substrata, salinity) beyond the tolerance range of an organism, then the action would be considered to “significantly impair” the habitat. Indicators of a significantly impaired habitat include but are not limited to: reduced carrying capacity, changes in community structure (food chain relationships, species diversity), reduced productivity and/or increased incidence of disease and mortality.

The LWRP should also ensure that if a proposed action would significantly impair the habitat, and if no practical alternative exists, it could occur only if there were overriding regional or statewide public benefits resulting from the action; the action furthered achievement of one or more other coastal policies; and all reasonable measures to mitigate the adverse impacts on the habitat were applied.

Commercial Fishing

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy “to conserve, protect and where appropriate promote commercial...use of fish...resources...”(Section 912.3). Therefore, DOS regulations require that to be approved a LWRP must further the following policy: *“FURTHER DEVELOP COMMERCIAL FINFISH, SHELLFISH AND CRUSTACEAN RESOURCES IN THE COASTAL AREA BY:*

1. *ENCOURAGING THE CONSTRUCTION OF NEW OR IMPROVEMENT OF EXISTING ON-SHORE COMMERCIAL FISHING FACILITIES;*
2. *INCREASING MARKETING OF THE STATE’S SEAFOOD PRODUCTS; AND*

3. *MAINTAINING ADEQUATE STOCKS AND EXPANDING AQUACULTURE FACILITIES SUCH EFFORTS SHALL BE MADE IN A MANNER WHICH ENSURES THE PROTECTION OF SUCH RENEWABLE FISH RESOURCES AND CONSIDERS OTHER ACTIVITIES DEPENDENT ON THEM.*"

A tremendous opportunity for expanding the State's commercial fishing industry was created with the passage of the federal Fishery Conservation Management Act of 1976. This law provides U.S. fishermen priority rights to harvest the millions of tons of fish previously being caught by foreign fishing fleets. To realize this development potential, New York must make adjustments in the harvesting, processing and marketing sectors of its fishing industry. The single greatest opportunity for local governments to play a role in commercial fishery resource development exists with the establishment of shore-side support facilities. At present, limited availability of docking, unloading and processing facilities impedes the growth of offshore deepwater fisheries. An insufficient number of boat ramps, inadequate catch transfer sites, and lack of shellfish processing and gear storage facilities limit development of the nearshore fisheries.

A second major opportunity for involvement by local governments in commercial fishery resource development is in the area of aquaculture. Today the market demand for aquaculture products (e.g., clams, oysters, striped bass) far outstrips current production levels of these high value seafood products.

I. Determining the degree to which this policy applies to each locality

Coastal communities, particularly those located along New York's coast where commercial fishing is not being restricted due to toxic contamination of the fishery resource, are being encouraged through this Program to direct their energies in helping to foster growth of the State's commercial fishing industry. Communities which have established fishing ports or could accommodate new commercial fishing development activities as part of harbor development programs are those communities which would be in the best position to implement this policy.

II. Identifying the techniques available and suitable for implementing this policy

Municipal zoning regulations can be used to provide increased utilization of commercial fin and shellfish. Marine commercial zones can be established in areas where such facilities as marinas, commercial docks, and fish processing plants would be appropriate. Such zoning would reduce competition for dock space between sport and commercial fishermen, and hence reduce the access problem for commercial fishing activities. Provision may also be made for the storage of fishing gear in residential areas.

In addition, municipalities have capital construction powers which might be used to provide infrastructural improvements necessary for commercial fishing. Roads, piers, docks, lighting, and sanitary sewers are all facilities that can be improved or constructed to aid the commercial fishing industry. Financing such infrastructure improvement projects could be achieved through the creation of a special improvement district and then taxing beneficiary property owners accordingly.

III. Determining whether a community's treatment of this policy is adequate

A municipality's treatment of this policy would be considered adequate if:

- (1) the community has realistically assessed the potential for commercial fisheries development in its area of jurisdiction,
- (2) identified a practical and meaningful role it could play in promoting commercial fishery development,

- (3) identified a means of funding this development effort,
- (4) made adjustment as needed in its zoning code to provide for such activities along its waterfront
- (5) prevented incompatible development adjacent to existing on-shore support facilities which might ultimately force the future dislocation of that facility.

Recreational Use of Fish and Wildlife

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy “to conserve, protect and where appropriate promote...recreational use of fish and wildlife resources...”(Section 912.3). Therefore, DOS regulations require that to be approved a LWRP must further the following policy: “*EXPAND RECREATIONAL USE OF FISH AND WILDLIFE RESOURCES IN COASTAL AREAS BY INCREASING ACCESS TO EXISTING RESOURCES, SUPPLEMENTING EXISTING STOCKS AND DEVELOPING NEW RESOURCES. SUCH EFFORTS SHALL BE MADE IN A MANNER WHICH ENSURES THE PROTECTION OF RENEWABLE FISH AND WILDLIFE RESOURCES AND CONSIDERS OTHER ACTIVITIES DEPENDENT ON THEM*”.

In New York the primary responsibility for managing the State’s fish and wildlife rests with the New York State Department of Environmental Conservation. Any efforts to increase recreational use of fish and wildlife, whether through private or public sector initiatives, will have to be done in accordance with existing state law and in keeping with sound resource management considerations. Such considerations include: biology of the species, carrying capacity of the habitat, public demand, costs, and available technology.

Recreational use of fish and wildlife resources is meant to include more than simply hunting and fishing activities. Promotion of other non consumptive uses of these resources such as bird watching, wildlife photography and nature study would also be considered desirable and appropriate objectives of a local waterfront revitalization program.

I. Determining the degree to which this policy applies to each locality

As part of its inventory of coastal resources, a local government should determine whether valuable hunting or fishing resources or natural areas exist in its waterfront area. Next the coastal community should consult and cite existing recreation needs inventories prepared either locally or by state agencies⁷⁴ to assess and document the need to provide increased opportunities for recreational enjoyment of its coastal fish and wildlife resources.

Given the existence of the resources and the need for increased recreational use of these resources, a local government should respond to this policy in its local waterfront revitalization program.

II. Identifying the techniques available and suitable for implementing this policy

The most important means by which local governments can assist with increasing recreational use of the State’s fish and game resources is by either creating new access to them or by preventing land use development which will preempt existing access to these resources. Local governments may exercise their powers to acquire fee simple or less-than-fee-interests (e.g., easements) in land to provide for increased access to public fish and game resources. On the other hand, local governments could, through site plan review or planned unit development, induce a developer to provide for public access to public fishing and hunting areas in the event that such development activities would otherwise block public access to such resources.

III. Determining whether a community's treatment of this policy is adequate

Municipalities may be encouraged to utilize their acquisition powers to provide for increased public access to recreational fish and game resources, within the limits of local fiscal capabilities. Municipalities will, however, be required to make a finding that their proposed LWRP will not preempt existing or future access to these resources. If such impacts are unavoidable, provisions must be made for new access opportunities which are at least equivalent to those being eliminated by the implementation of the proposed program.

Flood and Erosion Hazards

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy: “to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing shoreline erosion” (Section 912.1) and “to minimize damage to natural resources and property from flooding and erosion, including proper location of new land development, protection of beaches, dunes, barrier islands, bluffs and other critical coastal features and use of non-structural measures, whenever possible” (Section 912.5). The Act also states that a LWRP must incorporate, to an extent commensurate with the particular circumstances of the local government, the “protection of sensitive ecological areas, including dunes.... and the protective capability of coastal land features” (Section 915.g). Therefore, DOS regulations require that to be approved a LWRP must further the following policies:

- (1) *“ACTIVITIES OR DEVELOPMENT IN THE COASTAL AREA WILL BE UNDERTAKEN SO AS TO MINIMIZE DAMAGE TO NATURAL RESOURCES AND PROPERTY FROM FLOODING AND EROSION BY PROTECTING NATURAL PROTECTIVE FEATURES INCLUDING BEACHES, DUNES, BARRIER ISLANDS AND BLUFFS. PRIMARY DUNES WILL BE PROTECTED FROM ALL ENCROACHMENTS THAT COULD IMPAIR THEIR NATURAL PROTECTIVE CAPACITY.”*
- (2) *“THE CONSTRUCTION OR RECONSTRUCTION OF EROSION PROTECTION STRUCTURES SHALL BE UNDERTAKEN ONLY IF THEY HAVE A REASONABLE PROBABILITY OF CONTROLLING EROSION FOR AT LEAST THIRTY YEARS AS DEMONSTRATED IN DESIGN AND CONSTRUCTION STANDARDS AND/OR ASSURED MAINTENANCE OR REPLACEMENT PROGRAMS.”*
- (3) *“ACTIVITIES AND DEVELOPMENT INCLUDING THE CONSTRUCTION OR RECONSTRUCTION OF EROSION PROTECTION STRUCTURES, SHALL BE UNDERTAKEN SO THAT THERE WILL BE NO MEASURABLE INCREASE IN EROSION NOR FLOODING AT THE SITE OF SUCH ACTIVITIES OR DEVELOPMENT OR AT OTHER LOCATIONS.”*
- (4) *“MINING, EXCAVATION OR DREDGING IN COASTAL WATERS SHALL NOT SIGNIFICANTLY INTERFERE WITH THE NATURAL COASTAL PROCESSES WHICH SUPPLY BEACH MATERIALS TO LAND ADJACENT TO SUCH WATERS AND SHALL BE UNDERTAKEN IN A MANNER WHICH WILL NOT CAUSE AN INCREASE IN EROSION OF SUCH LAND.”*
- (5) *“PUBLIC FUNDS SHALL ONLY BE USED FOR EROSION PROTECTIVE STRUCTURES WHERE NECESSARY TO PROTECT HUMAN LIFE, AND NEW DEVELOPMENT WHICH REQUIRES A LOCATION WITHIN OR ADJACENT TO AN EROSION HAZARD AREA TO BE ABLE TO FUNCTION, OR EXISTING DEVELOPMENT; AND ONLY WHERE THE PUBLIC BENEFITS OUTWEIGH THE LONG TERM MONETARY AND OTHER COSTS INCLUDING THE POTENTIAL FOR INCREASING EROSION AND ADVERSE EFFECTS ON NATURAL PROTECTIVE FEATURES.”*
- (6) *“WHENEVER POSSIBLE, USE NON-STRUCTURAL MEASURES TO MINIMIZE DAMAGE TO NATURAL RESOURCES AND PROPERTY FROM FLOODING AND EROSION. SUCH MEASURES SHALL INCLUDE: (i) THE SET BACK OF BUILDINGS AND STRUCTURES; (ii) THE PLANTING OF VEGETATION AND THE INSTALLATION*

OF SAND FENCING AND DRAINAGE SYSTEMS; (iii) THE RESHAPING OF BLUFFS; AND (iv) THE FLOOD-PROOFING OF BUILDINGS OR THEIR ELEVATION ABOVE THE BASE FLOOD LEVEL.”

Fortunately, in great part, the framework is already established for a community’s treatment of the above policies through the Coastal Erosion Hazard Areas law (Environmental Conservation Law Article 34) and the National Flood Insurance Program (in which communities must participate according to Environmental Conservation Law Article 36). However, because the policy in Section 912.5 of the Waterfront Revitalization of Coastal Areas and Inland Waterways law is not already covered by an existing means of implementation, the guidelines for its treatment are described in greater detail in section II below.

I. Determining the degree to which these policies apply to each locality

Flooding and erosion are two of the most familiar phenomena in the coastal area, but their severity, and thus their significance in the preparation of a LWRP, will vary among communities. Therefore, it will be necessary first to establish in each community if flooding and erosion occur, to what extent, and where.

In the case of coastal flooding, data supplied by the Federal Emergency Management Agency (FEMA) under the National Flood Insurance Program are the means to be relied upon in making that determination. Such data are included in Flood Hazard Boundary Maps and Flood Insurance Rate Maps. If a coastal community has been provided with those data, then the LWRP policies will apply in identified flood-prone areas.

In the case of coastal erosion, the Department of Environmental Conservation (DEC) is required by Section 34-0104 of Article 34, ECL, to identify coastal erosion hazard areas (CEHAs). Where such areas have been identified in a community, the LWRP policies will apply.

In a community where DEC has not yet surveyed the coastal area, DOS will request that DEC make a preliminary determination, in consultation with the local government, as to the likelihood that there are CEHAs in the community’s coastal area and indicate their probable location. If DEC finds that there is little likelihood that such areas are present, then the community’s LWRP need not take account of these policies. (Some communities may desire, nevertheless, to adopt erosion ordinances in the absence of identifiable CEHAs due to local concerns, and are encouraged to do so.) However, should DEC make a positive preliminary finding regarding CEHAs, then DOS will consult with DEC and the local government to make arrangements for formal identification of the CEHAs as soon as possible under the provisions of Section 34-0104 as noted above. Unavoidable delays in the formal identification of CEHAs caused by factors beyond the control of the local government need not prevent approval by DOS of a LWRP which meets all other requirements of Article 42. However, a timetable must be agreed upon by DEC, DOS and the local government for completion of that identification process. (See also III below).

II. Identifying the techniques available and suitable for implementing these policies

Implementation of the flooding and erosion policies can be achieved by the use of familiar tools developed under local government police powers. In communities with existing zoning ordinances, new provisions can be added as revisions. Where zoning has not been introduced as a planning instrument, building codes may be prepared to meet those requirements. Whether or not zoning is in place, subdivision regulations should be developed. Communities may also find the SEQR process a productive auxiliary device in treating the policies. Last, the policy which requires “the use of non-

structural measures, whenever possible” may be incorporated in the procedures of the existing laws or ordinances dealing with flooding and erosion.

III. Determining whether a community’s treatment of these policies is adequate

a. A community’s treatment of the flooding and erosion policies (except the policy in Section 912.5 of the Waterfront Revitalization of Coastal Areas and Inland Waterways law) will be considered adequate if, where applicable as determined in I above, the community can demonstrate that it has enacted or will establish according to an agreed-upon schedule, the following:

- (1) Flooding Local laws or ordinances which meet the regulatory requirements of the National Flood Insurance Program consistent with the most current flood data provided by FEMA. This means that where further data has been provided by FEMA which would enable the community to upgrade its regulation of identified flood hazard areas, it must do so by enacting the appropriate ordinances or laws.
- (2) Erosion Local ordinances or laws to regulate development and activities in coastal erosion hazard areas which have been certified by the Commissioner of DEC according to Section 34-0105 of Article 34, ECL.

b. In both flooding and erosion hazard areas, the community’s LWRP must also take into account the policy enunciated in Section 912.5 which requires “the use of non-structural measures, whenever possible” to minimize damage from erosion or flooding. First, recognizing the high cost and potentially adverse impacts of such structural measures as groins, dams and bulkheads, a community should address this policy by identifying “non-structural measures” appropriate to its shoreline, including:

- (1) Within identified coastal erosion hazard areas
 - (a) the use of setbacks as provided for in Section 34-0108 (Article 34, ECL);
 - (b) the strengthening of coastal landforms by the planting of appropriate vegetation on dunes and bluffs, the installation of sand fencing on dunes, the reshaping of bluffs to reduce the potential for slumping and to permit the planting of stabilizing vegetation, and the installation of drainage systems on bluffs to reduce runoff and internal seepage of waters.
- (2) Within identified flood hazard areas
 - (a) the siting of new development or activities outside the flood hazard areas to avoid the risk of damage; and
 - (b) the flood-proofing of buildings or their elevation above the base flood level.

Second, the community must have established procedures to ensure that non-structural measures are used “whenever possible.” Such procedures must require that when property owners or governmental agencies propose to prevent or diminish damage from erosion or flooding by the use of structural measures, they must demonstrate clearly to the local government that it is not possible to use alternative non-structural measures which would afford a similar degree of protection. Satisfaction of this guideline can be obtained by

requiring that those proposing such structures submit evidence including analyses of the sites, the circumstances involved and of the protection measures, in sufficient detail so that the local government can make specific findings regarding the reasonableness of the proposals. Obviously, the procedures must also give the local government the power to require the use of non-structural measures where they are found to be effective.

Ice Management Practices

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares: that it is State Policy “...to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing the loss of living marine resources and wildlife, shoreline erosion,...or permanent adverse changes to ecological systems” (Section 912.1); “to conserve and protect fish and wildlife habitats...(Section 912.3); and “...to minimize damage to natural resources and property from flooding and erosion...”(Section 912.5). The Act also requires local governments to incorporate into their LWRPs the “...protection of sensitive ecological areas including dunes, tidal and freshwater wetlands, fish and wildlife habitats and the protective capability of coastal land features” (Section 915.5g.). Therefore, DOS regulations require that to be approved a LWRP must further the following policy: “*ICE MANAGEMENT PRACTICES SHALL NOT DAMAGE SIGNIFICANT FISH AND WILDLIFE AND THEIR HABITATS, INCREASE SHORELINE EROSION OR FLOODING, NOR INTERFERE WITH THE PRODUCTION OF HYDROELECTRIC POWER.*”

I. Determining the degree to which this policy applies to each locality

Although ice forms in the waters of most coastal communities, the degree to which this policy will apply to a particular locality will depend on the extent to which it has jurisdiction over these waters, the nature of the problems which necessitate ice management, and the effects of ice management practices. For example, emergency measures such as the breaking up of ice jams to prevent flood damage or the freeing of a ship from the ice would be exempt from this requirement.

II. Identifying the techniques available and suitable for implementing this policy

A local government may exercise its police powers through the enactment of appropriate ordinances or laws concerning ice management practices.

III. Determining whether a community’s treatment of this policy is adequate

First, a locality should provide data on the extent of its jurisdiction over coastal waters adjacent to its shores. Second, the locality should provide a description of ice management problems and practices in its coastal area. And third, local laws or ordinances designed to achieve the desired response should be prepared and enacted.

Public Access

Public access to both the recreational and aesthetic resources of the coast is a key element in the management of coastal areas. Development, private ownership of land, natural shoreline topography, inadequate public transportation, limited parking facilities, and non-resident restrictions are all factors which singly or in combination can restrict public access to existing recreation resources and to publicly owned lands and waters of the coastline at large. The Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42) addresses the public access issue by declaring that it is necessary to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing diminution of public access to the waterfront...” and

“to encourage and facilitate public access for recreational purposes.” Article 42 gives additional direction to local governments wishing to develop Waterfront Revitalization Programs by requiring such programs to call for “the increased use of and access to coastal waters and the waterfront for water-related activities such as boating, swimming, fishing, walking, and picnicking.” Given these general directions, DOS regulations have been developed which require that to be approved a LWRP must further the following policies:

- (1) *“PROTECT, MAINTAIN AND INCREASE THE LEVELS AND TYPES OF ACCESS TO PUBLIC WATER-RELATED RECREATION RESOURCES AND FACILITIES SO THAT THESE RESOURCES AND FACILITIES MAY BE FULLY UTILIZED BY ALL THE PUBLIC IN ACCORDANCE WITH REASONABLY ANTICIPATED PUBLIC RECREATION NEEDS AND THE PROTECTION OF HISTORIC AND NATURAL RESOURCES IN PROVIDING SUCH ACCESS, PRIORITY SHALL BE GIVEN TO PUBLIC BEACHES, BOATING FACILITIES, FISHING AREAS AND WATERFRONT PARKS.”*
- (2) *“ACCESS TO THE PUBLICLY-OWNED FORESHORE AND TO LANDS IMMEDIATELY ADJACENT TO THE FORESHORE OR THE WATER’S EDGE THAT ARE PUBLICLY-OWNED SHALL BE PROVIDED, AND IT SHOULD BE PROVIDED IN A MANNER COMPATIBLE WITH ADJOINING USES. SUCH LANDS SHALL BE RETAINED IN PUBLIC OWNERSHIP.”*

I. Determining the degree to which the policies apply to each locality

Every locality desiring to prepare a Waterfront Revitalization Program has the potential to provide or increase access to its waterfront for water-related activities. The amount and type of access and the kind of water-related activities to be emphasized will depend upon a number of factors. These include: the amount, location, type, condition, and use of existing waterfront recreation facilities and parks; the location and type of existing residential, commercial, and industrial development; the location of public transportation; the natural characteristics of the waterfront as they relate to potential recreation and access opportunities; and the types and location of specific uses and projects proposed to implement the local program objectives.

The initial inventory and analysis steps required of all localities wishing to prepare a program will reveal much of the information in the above factors about existing public access to the waterfront and the potential for maintaining or increasing access. Several different situations with respect to access are possible, depending upon the circumstances of the locality. For example, a locality with existing water-related recreation resources along its waterfront should show that existing access is sufficient or, if it is not, show how access can be improved.

On the other hand, a community may be developed to such an extent that little or no waterfront recreation facilities exist and there is little prospect for their development. In this case, the potential for increased access must focus on taking advantage, in existing development and in every proposed specific use or project, of the opportunity to provide access to the waterfront, even if it is just to an overlook from which to view the shoreline and its activities or the provision of a footbridge across a transportation facility to allow access to a city waterfront.

II. Identifying the techniques available and suitable for implementing these policies

There are several methods available to localities for maintaining or increasing access to the waterfront. Those most suitable for a locality’s particular situation should be identified in the waterfront program. The following methods should be considered:

A. Regulation

There are a number of regulatory techniques available to localities to increase public access to the waterfront. They may:

- (a) establish zoning districts, where appropriate, which prescribe water-related uses to facilitate public access for recreation;
- (b) require provision, through the site plan or special permit approval process, for open space and waterfront access;
- (c) establish design criteria and standards for large planned developments which ensure provision of waterfront access;
- (d) require access to the waterfront in new residential subdivisions through subdivision regulations; or
- (e) require “in lieu” fees for the acquisition of public access at locations other than that of the planned subdivision.

B. Land Acquisition and Capital Construction

A locality has broad powers to acquire and develop land for public purposes. These powers could be used to acquire fee or less than fee interests in land needed to increase public access to the waterfront as well as develop specific capital facilities to increase access.

III. Determining whether a community’s treatment of these policies is adequate

As stated above, communities have a variety of techniques available for maintaining and increasing access to the waterfront. The Department of State, in determining whether the techniques are adequate to meet the policy requirements of Article 42, will evaluate them against the circumstances of each locality. The following factors will be used to judge the effectiveness of the locality’s proposals for meeting the policy requirements:

A. The amount, location, type, and condition and use of existing waterfront access areas.

These factors relating to a community’s existing access areas will be reviewed in evaluating the effectiveness of its program proposals for dealing with access. The substance of the program proposals will vary from community to community, depending upon the characteristics of these factors. Obviously, if a community already has a large number of various types of access to the waterfront which are well-located, in good condition, and greatly used, its access needs are few and will be so reflected in its waterfront program. On the other hand, a community with access deficiencies, i.e., few access points, poorly-located, in poor condition, not well-used, etc., will be required to show in its program what it proposes to do to ameliorate the situation.

B. The location and character of existing development and the degree of pressure for additional development.

The nature of existing development and its location will have a great influence on the provision of increased access. A highly developed waterfront will effectively prohibit many types of access from being provided, as will the type of development, i.e., a transportation facility running the length of the community along its waterfront.

Conversely, a waterfront with little or no development could have many access opportunities if other factors are also favorable. Thus, a community's Waterfront Revitalization Program will have to recognize the nature of its development as it relates to the type of access being proposed. In the same fashion, the degree of pressure for additional development will particularly relate to the timing for increased access. Where development pressures are great, the timing or providing increased access must be such that opportunities are not foreclosed by development before action can be taken. Where there are few or no development pressures, timing will be a less important factor.

C. The natural characteristics of the waterfront as they relate to potential waterfront access opportunities.

This factor will be judged against a community's proposal for increasing access to ensure that the proposals are realistic in terms of existing natural characteristics. Simply put, these characteristics must match the type of access being proposed. For example, it would make little sense to propose increased access for fishing where water is polluted and fishing is banned, as is the case along some sections of the Hudson River.

D. The proposals in the program for specific uses and projects and the potential for maintaining or increasing access for each such proposal.

Each proposal for specific uses and projects in a community's waterfront program should reflect the feasibility of increasing access to the waterfront. This will be specifically looked for in each program. For example, a proposal for redevelopment of an abandoned waterfront warehouse into a civic center would be expected to contain a proposal for increasing access to the waterfront.

E. The fiscal capability of the locality measured against the cost of proposals for acquiring waterfront access areas and developing specific facilities.

The costs of proposed acquisition of land and development of facilities for increasing access must be realistic in terms of the fiscal resources of the community and the possibility of assistance from other sources.

Recreation

Coastal areas are New York's most important outdoor recreation resource. Their appeal and significance creates several concerns. Principal among these is determining how the demand for coastal area recreation can be met while ensuring that other land and water use needs will be accommodated and that the natural resource base will be protected. More specific concerns include: conflicts with other uses; overuse of existing coastal recreation areas; deficiency of water-based recreation in urban areas; conservation of historic and cultural resources; the particular needs of recreational boating and fishing; and the desire to promote the private sector's role in recreation.

The Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42) addresses recreation issues by declaring that it is necessary "to achieve a balance between economic development and preservation...while preventing...diminution of open space areas..."; "to...promote...recreational use of fish and wildlife resources..."; "to encourage and facilitate public access for recreational purposes..."; and "to encourage the restoration and revitalization of natural and [human-

made] resources.” Article 42 gives additional direction to local governments wishing to develop Waterfront Revitalization Programs by requiring such programs to call for “the increased use of and access to coastal waters and the waterfront for water-related activities such as boating, swimming, fishing, walking, and picnicking.” Therefore DOS regulations require that to be approved a LWRP must further the following policies:

1. *“WATER DEPENDENT AND WATER ENHANCED RECREATION SHALL BE ENCOURAGED AND FACILITATED AND SHALL BE GIVEN PRIORITY OVER NON-WATER RELATED USES ALONG THE COAST, PROVIDED IT IS CONSISTENT WITH THE PRESERVATION AND ENHANCEMENT OF OTHER COASTAL RESOURCES AND TAKES INTO ACCOUNT DEMAND FOR SUCH FACILITIES. IN FACILITATING SUCH ACTIVITIES, PRIORITY SHALL BE GIVEN TO AREAS WHERE ACCESS TO THE RECREATION OPPORTUNITIES OF THE COAST CAN BE PROVIDED BY NEW OR EXISTING PUBLIC TRANSPORTATION SERVICES AND TO THOSE AREAS WHERE THE USE OF THE SHORE IS SEVERELY RESTRICTED BY EXISTING DEVELOPMENT” AND*
2. *“DEVELOPMENT, WHEN LOCATED ADJACENT TO THE SHORE, SHALL PROVIDE FOR WATER-RELATED RECREATION, AS A MULTIPLE USE, WHENEVER SUCH RECREATIONAL USE IS APPROPRIATE IN LIGHT OF REASONABLY ANTICIPATED DEMAND FOR SUCH ACTIVITIES AND THE PRIMARY PURPOSES OF THE DEVELOPMENT.”*

I. Determining the degree to which the policies apply to each locality

Almost every locality desiring to prepare a Waterfront Revitalization Program has the potential to increase the use of its waterfront for water dependent and water-enhanced recreation activities. Because each locality’s waterfront is different, the amount and type of activities possible will differ and will depend upon a number of factors. These include: the amount, location, type, condition, and use of existing waterfront water-related recreation facilities and parks; the location and type of existing and proposed residential, commercial and industrial development; the location of public transportation; the potential recreation opportunities; and the types and locations of specific uses and projects proposed to implement the local program objectives.

The initial inventory and analysis steps required of all localities wishing to prepare a program will reveal much of the information about the above factors and thus the potential for increasing water-related recreational opportunities. Several different types of situations are possible with respect to increasing water-related recreation activities, depending upon the circumstances of the locality. For example, a locality with existing water-related recreation facilities along its waterfront should show that these facilities are sufficient or, if they are not, show how and where additional facilities can be provided. On the other hand, a locality may be developed to such an extent that little or no waterfront recreation facilities exist and there would be difficulties in providing for many types of such facilities. In this case, providing more of these facilities would depend upon coming up with imaginative proposals for fitting in appropriate types of new waterfront facilities with existing development. A third situation might be one in which a community has a large amount of undeveloped waterfront land with no waterfront recreational facilities. If a large-scale development were proposed for the community’s waterfront, the waterfront program would have to ensure that such a development provide water-related recreation facilities as a multiple use where appropriate.

II. Identifying the techniques available and suitable for implementing these policies

There are several means available to localities for increasing water-related recreation facilities along the waterfront. Those most suitable for a locality’s particular situation should be identified in the waterfront program. One of the means not described below but which can be used in conjunction with

either one or both is the use of cooperative arrangements between a locality and private developers to provide recreational opportunities in connection with new developments. The following means should be considered.

(A) Land Acquisition and Capital Construction

A locality has broad powers to acquire and develop land for public purposes. These powers could be used to acquire the lands and develop the facilities needed to increase the amount of water-related recreation on the waterfront. A provision of State law provides that the State Office of Parks, Recreation and Historic Preservation can cooperate with communities in the development of recreation facilities.

(B) Regulation

There are several regulatory methods localities can use to provide for increased recreation:

1. Zoning districts can be created, where appropriate, for the protection of natural resources such as wetlands or other features important for the development of certain kinds of recreation, such as sandy beaches for swimming. These districts can also prescribe selected water-related recreational activities or require the provision of open space as a condition of approval of major new developments which would then be used for recreation.
2. Flood plains or flood hazard districts can be created which permit parks, public and private marinas, boat launching sites, wildlife sanctuaries or other types of recreational uses not susceptible to substantial damage from floods.
3. Transfer of Development Rights (TDR) is a potentially valuable tool which can be used to provide for open space for recreation while permitting the development which otherwise would occur on that land to occur elsewhere in the locality.
4. Subdivision regulations can be used to require, as a condition of approval, the provision of lands for open space purposes where such developments occur in waterfront areas. Such regulations also allow, in lieu of providing land, payment of fees to the municipality to be used for purchase of parks and recreational land elsewhere.
5. Municipalities have the power, under General Municipal Law (Article 18-A), to establish industrial development agencies which can be used, among other purposes, for the promotion, development, encouragement, and assistance of private sector activities to improve waterfront recreational opportunities.
6. Local zoning or site plan approval ordinances may establish site design criteria and standards for large planned developments which can require the inclusion of recreation and open space use within such developments.

III. Determining whether a community's treatment of these policies is adequate

As stated above, communities have a variety of techniques available for increasing water-related recreation facilities along the waterfront. The Department of State, in determining whether the techniques chosen are adequate to meet the policy requirements of Article 42, will evaluate them against

the circumstances of each locality. The following factors will be used in judging the effectiveness of the locality's proposals for meeting the policy requirements:

(A) The amount, location, type, condition, and use of existing waterfront water-related recreation facilities.

These factors relating to a community's existing water-related recreation facilities will be reviewed in evaluating the effectiveness of its program proposals for dealing with recreation. The substance of the program will vary from community to community, depending upon the characteristics of these factors. Obviously, if a community already has a large number of various types of water-related recreation facilities which are well-located, in good condition, and used by its citizens, its need for additional facilities may not be great and will be so reflected in its waterfront program. On the other hand, a locality with deficiencies in water-related recreation facilities, i.e., few facilities with little variety in activities available; poor access in terms of public transportation; poorly maintained; not well-used, etc., will be required to show in its program what it proposes to do to ameliorate the situation.

(B) The location and type of existing and proposed residential, commercial, and industrial development and the degree of pressure for additional development.

The nature of existing and proposed development and its location will have a great influence on the provision of increased water-related recreation facilities. A highly developed waterfront will effectively prohibit many types of recreation facilities from being provided, as will the type of development, i.e., heavy waterfront industry, such as a steel mill, may not be compatible with adjacent waterfront recreation such as picnicking or swimming. On the other hand, a community with a sparsely developed waterfront may have many more opportunities for providing additional recreation facilities, if other factors are favorable. A community's Waterfront Revitalization Program will thus have to recognize the location and type of its existing development in its proposals for waterfront recreation facilities.

The degree of pressure for additional development will particularly relate to the timing for providing waterfront recreation facilities. Where development pressures are great, the timing for providing such facilities must be such that opportunities are not foreclosed by development before action can be taken.

(C) Proposals for large-scale developments to be located on the waterfront.

A community's Waterfront Revitalization Program should contain a procedure for ensuring that proposals for developments of this nature also contain recreation facilities as multiple uses where appropriate to the development and to other circumstances of the community.

(D) The natural characteristics of the waterfront as they relate to potential recreation opportunities.

This factor will be judged against a community's proposals for increasing recreation facilities to ensure that the proposals are realistic in terms of existing natural characteristics. Simply put, these characteristics must match the type of facilities being proposed. For example, a proposal for development of a beach for swimming must be reasonable in terms of the physical characteristics of the beach and the water to permit swimming.

(E) The proposals in the program for specific uses and projects to increase recreation opportunities.

Proposals to increase water dependent and water-enhanced recreation facilities will be specifically looked for in a community's Waterfront Revitalization Program. Such proposals will be expected to be given priority over non-water related proposals on the waterfront. The Department of State will also evaluate the proposals against the anticipated demand for them. This demand factor should be carefully developed to ensure that facilities will, in fact, be used by citizens of the community.

- (F) The fiscal capability of the locality measured against the cost of proposals for acquiring waterfront lands for recreation and developing specific facilities.

The costs of acquiring land and developing facilities for waterfront recreation must be realistic in terms of the fiscal resources of the locality and the possibility of assistance from other public and private sources.

Historic Resources

New York's coast is rich in structures, sites and areas of significance in the history, architecture, archeology and culture of the State. The Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42) recognizes the contribution of historic resources to the character and economic development potential of a community and requires the "promotion and preservation of...historic and cultural...resources as community amenities and tourist destinations", "the reuse of existing...building stock," and "the restoration and revitalization of...[human-made] resources." Therefore, DOS regulations require that to be approved a LWRP must further the following policy: "*PROTECT, ENHANCE AND RESTORE STRUCTURES, DISTRICTS, AREAS OR SITES THAT ARE OF SIGNIFICANCE IN THE HISTORY, ARCHITECTURE, ARCHEOLOGY, OR CULTURE OF THE STATE, ITS COMMUNITIES OR THE NATION*".

I. Determining the degree to which this policy applies to each locality

The amount of attention that a local program pays to historic resources will depend on the extent of these resources in a community. Some communities may retain along their waterfronts large areas of historic residential and commercial structures with few gaps or incongruous elements. Many other communities may have only one or two structures of historic interest scattered amongst more recent development. A few communities may retain little or no evidence of past history. Each community should, however:

- A. Record in the local resource inventory structures, sites and areas of significance in the history, architecture, archeology, and culture of the community, State or Nation.

Structures, sites and areas that the Department of State and others consider to be of significance include:

1. a resource which is in a federal or State park established, among other reasons, to protect and preserve the resource
2. a resource on, nominated to be on, or determined eligible to be on the National or State Registers of Historic Places
3. an archeological resource which is on the State Department of Education's inventory of archeological sites
4. a resource that is a significant component of an Urban Cultural Park

5. a local landmark, park, or locally designated historic district

Where a structure, site or district is of historic significance but has not been designated in one of the above ways, the community should take steps to see that it is officially recognized at least at the local level.

II. Identifying the techniques available and suitable for implementing this policy

New York State communities can protect historic resources in two general ways. They have substantial powers to regulate for the protection of historic and aesthetic resources, and they have broad powers to acquire real property.

There are two types of preservation regulations: those meant to apply to historic districts and those meant to apply to individual landmarks. The district approach applies where many or most of the buildings in a delineated area are of historic significance while the other, as the name indicates, is concerned with the preservation of individual buildings and possibly adjacent sites.

Generally a local historic preservation law establishes some procedure for nominating a district or landmark and then identifies the actions--alteration, new construction, demolition--which are subject to regulation. Also, the law usually contains standards for decisions made in reviewing proposed actions. The Department of the Interior's "Standards for Rehabilitation" and "Guidelines for Rehabilitating Historic Buildings" may serve as a good basis for detailed review standards. When permissible under State building and fire codes, these standards may be achieved in part by modifying local codes.

As mentioned above, communities can protect historic resources by acquiring interests in real property. Not only can they acquire full fee interests but also lesser interests. This is a valuable means of acquiring property to ensure its preservation while avoiding the cost of outright acquisition.

In addition to the local powers of regulation and acquisition, communities can encourage reuse of historic buildings by educating the public about federal tax incentives for historic rehabilitation. They can also operate programs to provide government grant monies to individuals for rehabilitating historic structures. Such grant programs have encouraged substantial private investment in the State's older developed areas.

III. Determining whether a community's treatment of this policy is adequate

To be considered adequate a program should:

- A. Provide assurance that significant historic resources will be protected

As described above, strong mechanisms are available to local governments for protecting historic resources. Depending on the extent of historic resources and the level of development pressure, a community's approach will vary. In many cases, adequate mechanisms are already in place; but in other cases, communities will need to strengthen their ability to protect single resources or a district.

- B. Demonstrate how the community will encourage re-use of historic resources

Traditionally, certain historic resources have been preserved because of their association with historic personages or events. More recently, historic preservation activities have expanded to

include buildings and areas that represent a particular historic era. The new historic preservation movement has sought to rehabilitate residential structures and adapt old commercial buildings to new uses. In addition to giving people a sense of time, place and meaning in terms of where they live and work, recent preservation projects have been beneficial for purely business reasons. For a start they have created jobs and trained new workers and are generally less costly per square foot than new construction projects.

To take advantage of the benefits of historic preservation and to encourage private sector involvement in the re-use of historic resources, a community can:

1. prepare a detailed program of incentives and goals for re-use of specific resources which are especially suited to various types of adaptation, perhaps as part of a larger recreational, residential or commercial project, or
2. at a minimum and as permissible, modify local codes and other regulations in order to facilitate appropriate adaptive re-use of historic structures.

Visual Quality

State policies on the waterfront recognize not only the inherent value of coastal scenery but also its social and economic worth. The Waterfront Revitalization of Coastal Areas and Inland Waterways law (Executive Law Article 42) declares that “impairment of scenic beauty” should be prevented at the same time that coastal resources are being developed. Article 42 gives additional direction in this regard to local governments wishing to develop local waterfront revitalization programs by strongly encouraging a community:

- (1) to promote and preserve “scenic, historic, cultural and natural resources as...amenities and tourist destinations” and
- (2) to apply “local aesthetic considerations in the design of new structures and the redevelopment of waterfront sites”. Therefore, DOS regulations require that to be approved a LWRP must further the following policies:

- (1) *“PREVENT IMPAIRMENT OF SCENIC RESOURCES OF STATEWIDE SIGNIFICANCE, AS IDENTIFIED ON THE COASTAL AREA MAP. IMPAIRMENT SHALL INCLUDE:*
 - (i) *THE IRREVERSIBLE MODIFICATION OF GEOLOGICAL FORMS, THE DESTRUCTION OR REMOVAL OF VEGETATION, THE DESTRUCTION OR REMOVAL OF STRUCTURES, WHEREVER THE GEOLOGIC FORMS, VEGETATION OR STRUCTURES ARE SIGNIFICANT TO THE SCENIC QUALITY OF AN IDENTIFIED RESOURCE; AND,*
 - (ii) *THE ADDITION OF STRUCTURES WHICH BECAUSE OF SITING OR SCALE WILL REDUCE IDENTIFIED VIEWS OR WHICH BECAUSE OF SCALE, FORM, OR MATERIALS WILL DIMINISH THE SCENIC QUALITY OF AN IDENTIFIED RESOURCE.”*
- (2) *“PROTECT, RESTORE AND ENHANCE NATURAL AND [HUMAN-MADE] RESOURCES WHICH ARE NOT IDENTIFIED AS BEING OF STATEWIDE SIGNIFICANCE, BUT WHICH CONTRIBUTE TO THE SCENIC QUALITY OF THE COASTAL AREA.”*

The DOS recognizes the great variation in the visual characteristics of communities throughout the coastal area. It also recognizes that resident attitudes towards visual quality vary greatly depending not only on a community’s physical character but also on such conditions as major commercial and industrial activities, employment needs, and financial resources. In a resort town, residents may be very concerned about

preserving the natural and historic features which attract tourists; while in a small city where industries have folded, residents are likely to be far more concerned about unemployment than about dilapidated structures degrading their waterfront. Nonetheless, the DOS is committed to protecting, restoring and enhancing the visual quality of the State's coastal areas. The Department expects each community, at a minimum, to assess the visual quality of its waterfront and to appropriately strengthen its capability for responding to potential visual impacts of future development.

I. Determining the degree to which these policies apply to each locality

- A. Describe in general the natural characteristics of the community's coastal landscape and also the appearance of land uses along its waterfront.

Every coastal community can be described in terms of visual quality. One community may be more attractive overall than another, but almost every community has some visual feature which is worthy of being protected, restored or enhanced. An agricultural village or historic fishing town may be visually pleasant from one end of the coastal area to the other; but even a highly industrialized community may have a visually dynamic waterfront which can be observed from at least a few access points.

- B. Record in the local resource inventory scenic resources of statewide significance.

The DOS will identify a limited number of scenic resources of statewide significance on the Coastal Area Map. These resources are unique in the State and of especially high quality. If a community believes that it contains a resource which should be designated on the Coastal Area Map, it may request as part of its local program that the map be amended to include this resource.

- C. Identify in the local resource inventory scenic resources of local or regional significance

The local inventory should include the location and geographic limits of scenic areas of local or regional significance. It should also include a description of the important components of each area and how they combine to create its scenic quality. Depending on the community, important components would include natural elements, such as distinctive geological features or views of coastal waters, and also architectural and other human-made elements of aesthetic, cultural and historic value.

Identification of scenic areas in the inventory should be reinforced by indications that the public recognizes the scenic value of these identified areas. Such recognition may be demonstrated by identification of an area in previous inventories, by public ownership, by public park development, or simply by regular use of an area by residents who enjoy its scenic qualities. Public recognition can be further substantiated through a public opinion survey.

- D. Identify in the local resource inventory specific degraded areas or general conditions which impair the visual quality of the entire waterfront.

The inventory of a community's waterfront should include areas that are visually degraded. In addition to the location and geographic extent of these areas, the inventory should describe the specific conditions, such as blighted piers and warehouses, which cause the unattractive appearance. The inventory should describe the relationship of these conditions to nearby land and water uses. Also, the inventory should identify degrading conditions, such as litter, billboards or junkyards, which affect the visual quality of the entire waterfront.

II. Identifying the techniques available and suitable for implementing these policies

Communities in New York can employ a wide variety of mechanisms to protect and improve visual quality. They can incorporate height and bulk restrictions or detailed site plan review provisions into zoning ordinances; allow clustering in subdivisions to preserve open space and scenic features; create special districts to protect and promote historic, cultural and scenic elements; prepare separate ordinances to prevent the visual abuses sometimes caused by signs, parking lots, junkyards, etc., or acquire property, scenic easements, or development rights.

III. Determining whether a community's treatment of these policies is adequate

In many instances, coastal communities have already instituted one or more of the local mechanisms available for managing visual quality and thus need few, if any, additions to enable them to more effectively oversee the visual evolution of their communities. However, some localities have not yet incorporated measures for improving or protecting visual quality; such measures may be particularly important in areas where significant scenic resources remain unguarded or where visual degradation seriously discourages economic development.

A. Provide assurance that the community will prevent impairment of any scenic resource identified as being of statewide, regional or local significance

The DOS is particularly concerned that a coastal community containing or adjacent to a scenic resource of statewide significance incorporates measures in its local program to protect the resource; the Department has similar concerns about regional and local scenic resources. The following activities would be likely to impair scenic beauty:

- removal of attractive vegetation
- modification of existing landforms
- demolition of attractive structures
- addition of structures or other elements (signs, towers, etc.) which are inappropriate in terms of use, materials, form, or scale, and/or which may completely or substantially block views of coastal waters.

Where scenic resources have been identified, a local program needs to demonstrate that it can respond to proposed development activities so as to prevent, or at least minimize, their negative effects on the identified resources. The local program could require such protective measures as:

- setting structures back from shorelines or in other inconspicuous locations to retain views to and from the shore;
- clustering or orienting structures to retain views, save open space and provide visual organization to a development;
- incorporating sound, existing structures (especially historic buildings) into the overall development scheme;
- removing deteriorated and/or degrading elements;

- maintaining or restoring the original land form, except when changes screen unattractive elements and/or add appropriate interest;
- maintaining or adding vegetation to provide interest, blend structures into the site, and obscure unattractive elements, except when selective clearing removes unsightly, diseased or hazardous vegetation and when selective clearing creates views of coastal waters;
- using appropriate materials, in addition to vegetation, to screen unattractive elements;
- using appropriate building scales, forms and materials which are compatible with and add interest to the landscape.

Local governments can incorporate such measures into their general site plan or environmental quality review and approval procedures and then apply the measures carefully to actions which might affect identified scenic resources. Depending on the type of resource, local governments could go further to create special districts which would include the resource and perhaps adjacent areas. In these districts, more strict standards would prevail than elsewhere in the community.

B. Determine what actions are most appropriate for specific degraded and/or scenic areas of the community's waterfront

By planning in advance, communities can direct some development activities toward specific degraded areas in need of improvement. They can also steer development away from especially sensitive scenic areas or take advantage of certain areas as settings for compatible types of development.

C. Provide assurance that the community has adequate tools for responding to potential impacts on the general visual quality of its waterfront

The need for tools to govern general visual quality will vary depending on the character of a community's waterfront and on development pressures. In a rural or suburban community experiencing growth pressures, the need for detailed site plan review procedures may be greater than in a highly developed community with little room for growth. In some communities, only one type of development (the proliferation of signs, parking lots, mobile homes...) may be spoiling the appearance of the waterfront. In such cases, a community may need a separate ordinance or a special section in the zoning ordinance to deal with the offending activity.

Agriculture

Agricultural land that lies within the coastal boundary of a community may not be a significant percentage of the total agricultural land in that community. It can, however, be one of the most important and extensive land uses within a community's coastal area and, if so, is often characterized by a higher percentage of prime and unique farmland than is found elsewhere in the State. In addition, much of such agriculture is dependent on its coastal location. Thus, though the goal of preserving valued agricultural lands is statewide in scope, the legislation includes a policy which, calls for "conserving and protecting agricultural land within the coastal area." Therefore, DOS regulations require that to be approved a LWRP must further the following policy: *"TO CONSERVE AND PROTECT AGRICULTURAL LANDS IN THE STATE'S COASTAL AREA, AN ACTION SHALL NOT RESULT IN A LOSS, NOR IMPAIR THE PRODUCTIVITY, OF IMPORTANT AGRICULTURAL LANDS,*

AS IDENTIFIED ON THE COASTAL AREA MAP, IF THAT LOSS OR IMPAIRMENT WOULD ADVERSELY AFFECT THE VIABILITY OF AGRICULTURE IN AN AGRICULTURAL DISTRICT OR IF THERE IS NO AGRICULTURAL DISTRICT, IN THE AREA SURROUNDING SUCH LANDS.”

Given the Program’s application to a narrow strip of land, implementing a policy of promoting agricultural use of land must, to be practicable, concentrate on controlling the replacement of agricultural land uses with non-agricultural land use. Many other factors which influence the viability of agriculture in a given area can only be addressed on Statewide or national basis.

I. Determining the degree to which this policy applies to each locality

Relative to the furthering of this policy, a locality wishing to prepare a LWRP will tend to fall into one of three situations. The more urban communities may have little or no agricultural land and need not address this policy at all. On the other hand, for many rural towns, agriculture is the principal industry of the coastal area; in these communities any waterfront revitalization program will have to recognize the primacy of agriculture, or even, if it chooses, have protection of agriculture as its major objective. The third situation is one in which agriculture is one of several activities along a town’s shore; in this situation the community wishing to prepare a LWRP must avoid use of agricultural land or inhibiting agricultural production but need not make protection of agriculture a major focus of its program.

The agricultural land that is to be protected is the agricultural land which is mapped on the Coastal Area Map or in the Coastal Atlas. Localities may identify additional agricultural lands of local importance and include their protection in the program.

II. Identifying the techniques available and suitable for implementing this policy

Several methods for conserving valued farmland have been utilized or proposed. The principal ones are: public purchase and lease back; farm value assessment and other tax changes; transfer of development rights; public purchase of development rights; zoning, either for exclusive agricultural uses, or very low density residential use; and the Agricultural District program and law.

Of the above methods, the public purchase and lease back will generally not appear to be suitable both from the viewpoint of the responsible public agency and the farmer, for while it ensures preservation of agricultural land, the costs are too high for the approach to be widespread, and it removes the land from direct ownership of the farmer. This technique is perhaps useful only with regard to a specific and very important farm when no other means are available. Farm value assessment is essential if farmers in the urban/rural fringe are to continue farming; however, of itself it is not sufficient to prevent conversion of farmland to urban use. New York law allows farmers who commit their land to agriculture for eight years to have their farms assessed for their agricultural value. This is a voluntary program but local governments may encourage its use. Localities should identify any such commitments.

The remaining methods have more direct application for the LWRP efforts to implement the policy of preserving agricultural lands in the coastal area.

Transfer of development rights is a relatively recent land use control technique. Its appeal is that it combines use of police power with partial compensation, thus avoiding the “taking issue”. The technique has primarily been used as a way to preserve a valued low intensity or relatively uneconomic use of land (but which has high value for its physical, social or other economic characteristics) in areas where there is pressure from more intensive development. The public benefit derived from this

technique is clear with regard to the land use or resource being preserved, for the land use or resource is preserved without requiring an economic sacrifice by the owner. The problems will come in choosing areas to which development rights will be transferred and assuring that there is a market for these rights in those locations. The Town of Southampton has incorporated a form of transfer of development rights in its zoning ordinance for the express purpose of preserving agricultural lands. Such an ordinance is one method that towns, in which development pressure on agricultural lands is strong, may choose to adopt.

Public purchase of development rights is a similar technique, in that is based on the separation of development rights from landownership. Because it is not a land use regulation per se and there is not a location to which development rights must be transferred, it is a simpler approach; however, it requires large expenditures of public money. Suffolk County has pioneered in the application of this procedure to the preservation of agricultural land. The authority for Suffolk County's program is found in the General Municipal Law, Section 247, which allows local government to acquire full title or lesser interest in lands to be preserved as open space. Such a method is available to the other areas of the State if the fiscal resources are available. This is a severe limitation on an otherwise very effective procedure.

Traditional zoning ordinances can also be a method by which localities can preserve valued agricultural lands. While zoning districts in which only agriculture and its accessory uses are permitted are not common, they have been upheld by courts, particularly in California. Such an approach might be considered by some localities. A more common zoning technique in rural communities has been to permit agricultural activities in areas zoned for large lot residential use. While this zoning is not as effective as the above procedures, it can be utilized in some areas, depending upon the degree of development pressure and the existing development patterns. If zoning is to be the method by which a coastal community preserves its agricultural land, the frequency and nature of changes and variances must be kept to a minimum for the technique to be effective.

The Agricultural District Program is the principal procedure developed by the State to preserve agricultural lands. While it may be completely effective in preserving agricultural land only where development pressure is not extreme, its provisions, in combination with other methods, it is a useful component of any LWRP. These provisions of the Agricultural District Program include farm value assessment, prohibition of local ordinances which restrict farm activity beyond the requirements of health and safety, restrictions on the use of eminent domain, restrictions on the power of special service districts to assess levies on farmland. While a locality may not initiate agricultural districts, it can be instrumental in encouraging their formation.

Another method a community may use is the SEQR process. A locality could amend its SEQR regulation to more specifically require an assessment of an action's impact on the preservation of agricultural land.

III. Determining whether a community's treatment of this policy is adequate

In developing a local waterfront revitalization program, communities with important agricultural lands may choose from a variety of methods (cf. III below) to conserve and protect agricultural lands. The DOS, in determining whether the method(s) chosen by a community are adequate to meet the requirement of Article 42, will evaluate the method(s) chosen according to the likelihood of its (their) effectiveness in preventing conversion of agricultural lands to other uses given the circumstances of each locality. The factors that will be considered in judging effectiveness are:

- 1) the type of farmland that exists along the shore (e.g. prime farmland in orchards or vineyards, other prime farmland, other unique farmland, farmland of statewide importance, etc.),
- 2) the economic, social and environmental importance of farming to the community,
- 3) the extent of farming in the coastal area and surrounding areas,
- 4) the degree of urban development pressure,
- 5) recent rates of loss or increase of land in farms,
- 6) the fiscal resources of the community, and
- 7) support of the method(s) by farmers. In general, the more important, in terms of soil quality and coastal dependency of the crop, etc., the agriculture is and the more development pressure there is, the more rigorous the method(s) for conserving the land will have to be in order to be judged likely to be effective.

As part of their program to conserve agricultural land, communities must provide assurance that the agencies of the local government, as well as the public, will not undertake or approve actions which are directly or indirectly detrimental to the conservation of important agricultural lands.

Water Quality and Coastal Development

The WRCAIW calls for "... a balance between economic development and preservation that will permit the beneficial use of coastal resources while...preventing...permanent adverse changes to ecological systems." More specifically the act requires that a local program include "protection of sensitive ecological areas, including but not limited to tidal and freshwater wetlands, fish...habitats.... Such protection will assure that land use or development will not affect such areas." Maintaining or achieving water quality is a major factor in realizing these and other benefits the coastal area has to offer. Conversely the type of desired land and water use should be reflected in the establishment of water quality objectives. Therefore, DOS regulations require that to be approved a LWRP must further the following policy: *"STATE COASTAL AREA POLICIES AND PURPOSES OF APPROVED LOCAL WATERFRONT REVITALIZATION PROGRAMS WILL BE CONSIDERED WHILE REVIEWING COASTAL WATER CLASSIFICATIONS AND WHILE MODIFYING WATER QUALITY STANDARDS; HOWEVER, THOSE WATERS ALREADY OVERBURDENED WITH CONTAMINANTS WILL BE RECOGNIZED AS BEING A DEVELOPMENT CONSTRAINT."*

I. Determining the degree to which this policy applies to each locality

Local governments should consult the New York Coastal Atlas to determine whether any waters within the proposed waterfront program boundaries are designated as "water quality limiting" or "effluent limiting." If any waters are so identified then they are overburdened with contaminants and must be considered to create a constraint to new development or redevelopment activities. It will be imperative that the local government consult with the regional DEC office to determine potential water quality impacts of the proposed program and to identify ways to mitigate these adverse impacts accordingly.

If a community's coastal waters are in either a higher or lower stream classification than seems necessary or appropriate in light of the community's desired land or water uses and a reasonable change in the classification could better accommodate those desired uses, then the community should include recommendations for modifying stream classification in its local program.

II. Identifying the techniques available and suitable for implementing this policy

From the locality's point of view, i.e., assuring that land and water uses are compatible with water quality objectives and that proposed land uses reinforce proposed water uses, the means for achieving this policy are traditional land use controls plus, where appropriate, controls on activities in or on the water. The other aspect of this policy, i.e. assuring that classification of coastal waters reflects proposed land and water uses of an approved program will be implemented as part of periodic reviews of stream classifications by DEC.

III. Determining whether a community's treatment of this policy is adequate

Localities should provide evidence that they have recognized existing water quality standards for their respective portions of coastal waters, considered the water quality impacts of their proposed program, and have consulted with technical water quality staff at DEC to identify ways to avoid or mitigate these impacts. The community must adopt and implement regulatory controls to assure that development activities proposed in the local waterfront program will not further degrade the quality of their coastal waters.

The locality's program should identify those portions of their coastal waters where the classification is inappropriate in light of proposed land and water uses. They should recommend reclassification to a classified 'B' should be recommended to be reclassified 'A' if that is reasonably attainable. Conversely, if a portion of a locality's coastal waters classified 'A' is adjacent to an area proposed for a major water dependent industry, it may be appropriate to recommend that it be reclassified if this would facilitate development of the water dependent industry and no valuable resources are dependent on the higher stream classification.

Other Water Quality Issues

The Waterfront Revitalization of Coastal Areas and Inland Waterways law declares that it is State policy "to achieve a balance between economic development and preservation that will permit the beneficial use of coastal resources while preventing...permanent adverse changes to ecological systems." That is to say the State of New York should assure that land and water use activities which occur along its coastal areas should not cause the destruction or impairment of coastal ecological systems. Aquatic systems, such as groundwater aquifers, tributaries, inlets, bays and estuaries, would be included. While the maintenance and enforcement of water quality standards have been traditionally the State's responsibility, there exist several opportunities for local governments to play an active role in augmenting the State's efforts in preserving water quality. In particular, municipalities should focus their efforts on several water quality problem areas for which DOS regulations have been developed. These regulations require that to be approved a LWRP must further the following policies:

- (1) "ENCOURAGE THE USE OF ALTERNATIVE OR INNOVATIVE SANITARY WASTE SYSTEMS IN SMALL COMMUNITIES WHERE THE COSTS OF CONVENTIONAL FACILITIES ARE UNREASONABLY HIGH GIVEN THE SIZE OF THE EXISTING TAX BASE OF THESE COMMUNITIES,"
- (2) "BEST MANAGEMENT PRACTICES WILL BE USED TO ENSURE THE CONTROL OF STORMWATER RUNOFF AND COMBINED SEWER OVERFLOWS DRAINING INTO COASTAL WATERS,"
- (3) "DISCHARGE OF WASTE MATERIALS FROM VESSELS INTO COASTAL WATERS WILL BE LIMITED SO AS TO PROTECT SIGNIFICANT FISH AND WILDLIFE HABITATS, RECREATIONAL AREAS AND WATER SUPPLY AREAS," AND
- (4) "BEST MANAGEMENT PRACTICES WILL BE UTILIZED TO MINIMIZE THE NON-POINT DISCHARGE OF EXCESS NUTRIENTS, ORGANICS AND ERODED SOILS INTO COASTAL WATERS."

I. Determining the degree to which these policies apply to each locality

Generally all communities which elect to develop LWRPs must consider and take effective steps to anticipate and mitigate the water quality impacts of any land and water use activities proposed in their LWRP.

In particular, a municipality's response to this policy will be contingent upon the nature of the primary water quality problems which either already exist or would likely result with the implementation of the proposed LWRP should proper measures not be taken to avoid or mitigate potential water quality impacts.

For example, there are instances where conventional sewer collection and treatment systems are not servicing waterfront properties and where installation of such facilities proves too expensive to be practical. If the proposed activities of a local waterfront revitalization program are likely to result in the release of untreated sanitary wastes into coastal waters, then the community would be expected to require that suitable alternative treatment facilities be installed and operated. The level of treatment required would depend upon existing State water quality standards and intended use of the waterfront (i.e. drinking water, swimming, boating, industrial water supply, etc.).

A critical need to manage surface runoff and control of non-point sources of nutrients, organics and eroded soils may exist in communities which:

- (1) have had to close their beaches or shellfishing areas due to pollution,
- (2) have been faced with chronic shoaling of their navigation channels, or
- (3) had major infestations of nuisance aquatic weed species choking their bays and inlets.

The types of pollutants being carried into waters include coliform and pathogenic bacteria (untreated sewage); agricultural, lawn, and garden chemicals; animal wastes; petroleum residuals from streets and parking lots; road salt; garbage and assorted debris; and eroded soil. Therefore, communities experiencing any of the above problems would need to address this policy.

Municipalities which own and operate solid waste management facilities (e.g., sanitary landfills, solid waste reduction or resource recovery facilities) located within the boundaries of their proposed LWRP must address potential groundwater and surface water pollution commonly associated with such facilities.

And, finally, communities dependent primarily on groundwater for their drinking water supply may need to regulate land use development activities which could degrade the water quality of their groundwater resources. Of particular concern are aquifer recharge areas, since it is in these areas where the potential of groundwater contamination is the greatest. For example, seepage from septic systems located on top of recharge areas could cause an increase in nitrate and chloride concentrations to levels exceeding drinking water standards and thereby render drinking water supplies unfit for human consumption.

This list of water quality problem areas should be considered as being suggestive of the range and types of water quality problems local governments might consider as they prepare their LWRPs.

II. Identifying the techniques available and suitable for implementing these policies

Alternative sewage treatment systems include individual septic tanks and other subsurface disposal systems, dual systems, small systems serving clusters of households or commercial users, and pressure or vacuum sewers. These types of systems are often more cost-effective in smaller less densely populated communities for which conventional facilities are too expensive. Financing these facilities can sometimes be achieved with use of state or federal funds. However, in the event these monies are unavailable, the community should have identified other means of securing needed funds, i.e., selling municipal revenue bonds, creating a special district and collecting user fees.

A variety of regulatory techniques could be adopted by communities to manage and control surface runoff. As appropriate, a municipality could adopt ordinances aimed at: controlling drainage and soil erosion from construction sites, pet control ordinances, controlled use of lawn fertilizer, and regulation of vegetation removal along stream banks or shore areas, or other potentially, suitable regulatory techniques available to local governments. In addition, municipalities could further policy implementation by altering their delivery of public services, e.g., improve street cleaning programs or reduce use of road salts.

Adoption of a special zoning classification, i.e., “Marine District” or adoption of a special sanitary wastes treatment ordinance are two means by which a municipality could regulate and prevent the discharge of vessel wastes into near-shore coastal waters.

While an outright ban on the construction of new solid waste management facilities within the coastal boundary could be enforceable through zoning restrictions, such an approach is not always feasible or practical. When siting a solid waste management facility near the waterfront proves necessary, or such a facility is already located there, technological devices such as leachate collection systems must be installed as required in the solid waste management permit.

Through zoning, municipalities can limit the type and density of land use development on lands overlying an aquifer recharge area. If homes in a subdivision rely on septic tank systems to treat sanitary wastes, then the density of development may need to be controlled. If sewers are installed, then this density restriction becomes less necessary.

Municipalities are also authorized under Article 2, Title 2, Section 228 of the Public Health Law to adopt and enforce a sanitary code, and thereby, prevent excessive nutrients from leaching into groundwater supplies. Furthermore, municipalities could consider adopting ordinances directed toward reducing animal wastes, use of domestic fertilizers, or restricting the sales of certain chemical cleaners used in septic systems that are known to have toxic residuals.

III. Determining is adequate

A community’s response to water quality issues will be dictated by the kinds of water pollution problems most prevalent in their coastal area. The following criteria will be applied as appropriate to each individual situation.

A community must demonstrate how it will prevent the release of sanitary wastes into coastal waters which might result from any development activities recommended in the LWRP, particularly when conventional sewage collection and treatment facilities are neither economically nor technically feasible. Installation of alternative treatment systems should be used when they are cost effective.

While most structural approaches (e.g., construction of retention basins, replacing combined sewers with separate sewers) to controlling the flow, storage and treatment of surface runoff are generally recognized as effective in reducing the discharge of pollutants into coastal waters, these approaches are, in most instances, not economically feasible, and will not be required of communities until affordable technology is developed. Therefore, a community's response could be considered adequate if, upon submission of its local waterfront revitalization program, either structural or nonstructural means (e.g., requiring best management practices for controlling erosion, and other regulatory controls as suggested above) of controlling surface water runoff are in place.

When a community has utilized its regulatory powers to require installation of vessel wastes treatment facilities as part of its harbor development plan, then its response to this policy will be considered adequate.

Any community will have satisfied this policy if it has a solid waste management plan approved by NYSDEC pursuant to the NYS Collection, Treatment and Disposal of Refuse and Other Solid Waste law (Environmental Conservation Law Article 27) or it has successfully obtained a construction or operation permit (pursuant to 6 NYCRR, Part 360) for a new facility proposed for construction within the coastal boundary. In instances where "midnight dumping" is a problem, municipalities should document the existence and magnitude of this problem and present a strategy for attempting to reduce or eliminate it altogether.

Specific standards by which one could assess a community's efforts to prevent groundwater contamination do not yet exist. In general, however, localities could exercise their police powers to limit the density of residential development in or near the vicinity of an aquifer recharge area.

Appendix C

Federal-New York State Consultation and Plan Coordination

CONSULTATION ACTIVITIES

The State's federal consultation process was initiated in 1975 with the identification of, and the establishment of contact with those agencies most likely to be affected by the Coastal Management Program. Those agencies were then invited to attend a Federal Coordination Workshop on October 6, 1976. Program information packets were sent to all agencies prior to the meeting. The workshop included presentations on New York's Program development activities, and exchanges of information and views on federal consistency, national interest, excluded federal lands and other requirements of the Coastal Zone Management Act pertaining to federal/state relations. Subsequent to that meeting, copies of several preliminary Program documents were mailed to federal agency contacts for review and comment: Goals and Objectives, Preliminary Statewide Boundary, and Geographic Areas of Particular Concern. As the State's Program development efforts gained momentum, a second federal agency workshop was held on September 15, 1977. Twenty-four federal agency representatives participated in discussions of both the content and alternative organizational approaches being developed for the State's Program as well as federal/state coordination concerns.

A major step in furthering the federal consultation process was taken when the March 1979 Draft New York State Coastal Management Program documents were sent for review and comment to all federal agencies with whom contact had been established (See Part Six of this document for a list of those agencies). Written responses received from ten federal agencies were evaluated by the Department of State and accommodated, where appropriate. The agencies' comments are on file at the Department of State.

Notices of public hearings held around the State on the Coastal Management Program were also mailed to federal agencies to afford them additional opportunities for comment.

At a less formal level, through participation in other workshops, committees, meetings on specific state and federal projects, and consultations on mutual concerns, Program staff has continued to maintain an information exchange with the federal agencies including updates on the status of the Program.

PLAN COORDINATION

The State Coastal Management Program's Plan Coordination efforts have been ongoing since the inception of its development through the use of two approaches. First, the Department of State entered into contracts with State, regional, county and municipal governmental agencies to obtain data on coastal resources, issues and existing plans and programs which could be employed in Program development. The list of Agencies included all those designated under Sections 201 and 208 of the Clean Water Act at the state, regional and city level. Second, the 1979 Draft Coastal Management Program was submitted to all coastal area governments as well as to state agencies.

Comments were received at public hearings and in writing, and if there were conflicts of a regulatory or programmatic nature, they were accommodated in the revised Program document or a mutual resolution

negotiated. In December 1981, a second Draft Coastal Management Program was sent to state agencies for review. Comments received have been analyzed and no substantive conflicts found.

Appendix D

Excluded Federal Lands in the Coastal Area

Excluded Federal Land (includes underwater lands)

- ¹⁷ Statements in this paragraph are summarized from language in the New York State Department of Environmental Conservation and New York State Department of State's Ocean Action Plan (2015) found at <http://www.dec.ny.gov/lands/84428.html> and the New England Interstate Water Pollution Control Commission's 2015 report, *Long Island Tidal Wetlands Trends Analysis* found at <http://www.dec.ny.gov/lands/5113.html>.
- ¹⁸ Statements below draw from language in the New York Ocean and Great Lakes Ecosystem Conservation Act.
- ¹⁹ Prior to 1973, some freshwater wetlands (except those on Long Island) were being protected under the Stream Protection Act (Environmental Conservation Law, Article 15, Title 5). Wetlands contiguous to navigable waters and wetlands associated with protected waters (streams and rivers with a classification of C or higher) were and still are being regulated under this Act. In 1973, however, New York increased its regulatory controls over wetlands along the marine coast with the passage of the Tidal Wetlands Act. In 1975, the State adopted the Freshwater Wetland Act.

- ⁴¹ New York Crop Reporting Service New York State Department of Agriculture & Markets
- ⁴² Unless otherwise identified all data is from the 1978 U.S. Census of Agriculture (published in 1982) and is for farms with sales of over \$2,500.
- ⁴³ According to the U.S. Censuses of Agriculture for 1969 and 1978, the amount of land in New York in farms with sales over \$2,500 was 2,99P, 395 and 3,010,231 respectively, an increase of 0.4 %.
- ⁴⁴ Recent changes in tax law have reduced this burden on farm owners.
- ⁴⁵ Howard Conklin, The Nature and Distribution of Farming in New York State, New York State College of Agriculture, 1968.
- ⁴⁶ New York State Office of Planning Coordination, New York State Development Plan 1, 1971, p. 48
- ⁴⁷ Note: Since the above definition was adopted, the State has developed a new system for identifying and valuing farmland. In the future the program will shift to this definition. The land captured by it is essentially the same.
- ⁴⁸ This term is defined in the explanation of Program Policy 26.
- ⁴⁹ The references are to sections of the Federal Water pollution Control Act of 1972 (PL 92-500).
- ⁵⁰ New York State Land Use Element, Department of State, 1978, p. 25.
- ⁵¹ Parks and Recreation Law (Title C, Article 14, Section 14.01).
- ⁵² After mapping according to this definition was substantially completed, the NYS Department of Agriculture and Markets completed development of a new agricultural land classification system. As soon as is practical, the following definition will be the basis for revising the maps of coastal agricultural land. Important agricultural land shall include all land within an agricultural district or subject to an eight-year commitment that has been farmed within at least two of the last five years, or any land farmed within at least two of the last five years in soil groups 1-4 as classified by the Land Classification System established by the NYS Department of Agriculture and Markets, or any land farmed within at least two of the last five years that is influenced by climate conditions and that support the growth of high value crops. Additionally, agricultural land not meeting the above criteria but located adjacent to any such land and forming part of an on-going agricultural enterprise shall be

considered important agricultural land.

- ⁵³ For the purposes of this map the urban areas which are to be excluded are all cities, the counties of Nassau, Westchester, Rockland, Putnam and Erie, and any built up area (this applies to c. also).
- ⁵⁴ A farm is defined as an area of at least 10 acres devoted to agricultural production as defined in the Agricultural District Law and from which agricultural products have yielded gross receipts of \$10,000 in the past year.
